

NUMBATRAK

Developer Brief

Navigation, Features & Build Plan

Based on product meeting — June 2026 · Confidential · For Developer Use Only

Build it as if going public. Test privately first.

This document defines the Numbatrak navigation restructure, tab groupings, feature scope for each section, what is missing and needs to be added, and the full Phase 1 and Phase 2 build plan. It is the single reference document for the developer from this meeting forward.

— SECTION 01 —

Context and Starting Point

This document is produced from the June 2026 product strategy and technical planning meeting between the founder (Toheeb) and the lead developer. It is the reference document for what needs to be built, in what order, and why.

"Build Numbatrak as if going public — but test privately first using the founder's own brands as the first tenants."

Numbatrak is a business intelligence platform for Nigerian physical-product and COD e-commerce businesses. Its core job is to show a business owner their key numbers at a glance — orders, delivery rate, AOV, CPA, profit per order, ad ROAS, funnel-level and business-level performance — so they can make decisions based on data, not gut feeling.

CURRENT TECHNICAL STATE

- React single-page application backed by Supabase (PostgreSQL)
- Built originally for single-organisation internal use — Numbatrak's own brands
- Row-Level Security (RLS) already in place and solid — this is confirmed
- Multi-tenant isolation has been tested — data does not bleed between accounts
- Emails do not work yet — this is a live blocker
- No forgot-password functionality exists
- No subscription or RBAC system exists
- No super-admin dashboard exists
- No Terms of Service or Privacy Policy

— SECTION 02 —

Build Phases and Timeline

The build is split into two phases. Phase 1 is the current contract scope — stabilise everything that already exists. Phase 2 is the public feature build, contingent on a contract extension.

PHASE 1	End June / Early July	Stabilise the existing software. Fix what is broken. Make everything that already exists work correctly. In-house team begins using by mid-July.
PHASE 2	Mid-August 2026	Public feature build — RBAC, subscriptions, multi-company, super-admin, working email, HR integration. Requires contract extension.
IN-HOUSE TEST	Through August	Founder's ~8 own brands onboarded as tenants. Dog-food every feature before external users touch it.
PUBLIC LAUNCH	~August 28, 2026	Public launch. Target: 1,000 users within one month. Aligned to founder's birthday.

THE EIGHT INTERNAL TEST BRANDS — FIRST TENANTS

These brands will be registered as separate tenant accounts during private testing: Monagia, Soevisou, Petabuy, QuickBuy, Confam, UrbanShop, Kinikon, and one additional brand. Each gets its own email login and appears as a separate organisation in the super-admin.

— SECTION 03 —

Navigation Restructure — Sidebar

The current sidebar has too many ungrouped tabs. Several are duplicates of the same concept. Several are missing entirely. The navigation must be restructured into logical groups before any further UI work happens.

The flags used below indicate what action is needed for each tab:

- NEW — does not exist, must be built
- RENAMED — exists but name needs to change
- MERGED — two tabs being collapsed into one
- KEEP — exists and name is correct

OVERVIEW	TAB NAME · DESCRIPTION
	Dashboard KEEP <i>The main performance view. Business numbers at a glance — orders, delivery rate, AOV, CPA, profit per order, ad ROAS. Filter by product and date range. See Section 05 for full metric breakdown.</i>
ORDERS	TAB NAME · DESCRIPTION
	Orders KEEP <i>All incoming orders across all sources. Status management — new, confirmed, packed, dispatched, delivered, failed, returned.</i>
	Order Forms RENAMED <i>The embeddable COD order form builder. Create, manage, and get embed code for order forms that live on external COD landing pages.</i>
	Abandoned Carts KEEP <i>Orders that were started but not completed. Trigger follow-up messages to recover them.</i>
DELIVERY	Follow-Ups KEEP <i>Post-purchase follow-up messages to customers after delivery is confirmed.</i>
	TAB NAME · DESCRIPTION
	Waybills KEEP <i>Individual waybill records. Each waybill is recorded twice — once to update inventory (products assigned to an agent) and once as a cost/delivery entry so monthly waybill spend can be tracked.</i>

	Agents KEEP <i>Delivery agents. Assign orders to agents. Track which agent handled which order. Deactivate agents (not just delete — deactivation keeps history).</i>
	Delivery Analytics MERGED <i>Merge of the current Summary tab and Waybill Statistics tab into one page. Shows: total waybills, cost price of products in those waybills, total deliveries done, deliveries outside Lagos, value of goods currently outside, delivery rate by location (Lagos vs outside Lagos).</i>
PRODUCTS	Products KEEP <i>Product catalogue. Add, edit, deactivate (not just delete) products. Each product has name, SKU, cost price, selling price, variants, quantity. Deactivation stops orders from being placed against it while keeping history.</i>
	Inventory KEEP <i>Stock levels, low stock alerts, out-of-stock flags, damaged/lost stock recording, stock reconciliation. Inventory auto-deducts when an order is placed and is tied to the delivering agent.</i>
FINANCE	Wallet RENAMED <i>Renamed from Remittance. Money in based on revenue generated — all payments received from delivered orders. Shows total collected, pending remittance, and released amounts.</i>
	Expenses KEEP <i>Four expense categories tracked separately: Operational, Building, Marketing, and Advertising. See Section 06 for full breakdown.</i>
	Invoicing NEW <i>Auto-generated invoice per order. Includes product, quantity, price, customer details, business details. Shareable as PDF or WhatsApp link. Status tracked — paid, unpaid, partially paid.</i>
	Accounting NEW <i>Business-level financial summary. Revenue, expenses per category, net profit, expense as percentage of revenue. Connects to the profitability dashboard calculations.</i>
PERFORMANCE	Funnel Analytics NEW <i>Ad performance tracker at the funnel level. Per funnel: ad spend, total orders generated, total orders delivered, platform CPA, real CPA, delivery rate, profit per order. Multiple funnels per product supported. Multiple offers per funnel supported.</i>
	Business Analytics NEW

	<i>Business-level performance summary. Aggregates all funnels. Shows business ROAS vs business ROI as two clearly separate numbers. Total profit after all expense categories applied.</i>
SETTINGS	TAB NAME · DESCRIPTION
	Integrations RENAMED <i>Renamed from Automation Logs. Shows all connected third-party services — email platform, SMS platform, payment gateway, Meta Pixel, Conversion API. Status per integration. Connection and disconnection controls.</i>
	Organization Settings KEEP <i>Business name, logo, contact details, notification preferences, team members and permissions, billing and subscription management.</i>

TABS BEING REMOVED ENTIRELY

- Summary — content merged into Delivery Analytics
- Waybill Statistics — content merged into Delivery Analytics
- Automation Logs — replaced by Integrations
- Forms — renamed to Order Forms and moved under Orders group
- Remittance — renamed to Wallet

— SECTION 04 —

Wallet — What It Should Look Like

Wallet is the money-in view. It shows the founder exactly what revenue has been generated, what has been collected, what is pending, and what has been released. It is not a payment processor — it is a tracking and visibility layer for all money flowing into the business from delivered orders.

What Wallet Shows

- Total revenue generated — sum of all delivered order values in the selected period
- Total collected — payments confirmed received from COD remittances and online payments
- Pending remittance — orders delivered but cash not yet confirmed received from agent
- Released to business — confirmed received and reconciled
- Breakdown by payment method — COD vs online payment
- Breakdown by time period — today, this week, this month, custom range
- Per-order payment status — which specific orders are paid, pending, or outstanding

Remittance Flow for COD

When a COD order is delivered, cash is collected by the delivery agent. The agent remits to the business. The Wallet view tracks this as:

1. Order marked as delivered in the Waybills section
2. Order appears in Wallet as Pending Remittance
3. Business owner or admin confirms cash received from agent
4. Order moves to Collected
5. Revenue is now reflected in the profitability dashboard

This flow ensures the dashboard never shows revenue that has not actually been received — which is a critical distinction for COD businesses where orders can be returned after being marked delivered.

— SECTION 05 —

Dashboard — What the Metrics Mean

The dashboard is the most important screen in Numbatrak. Everything here is auto-calculated from data already entered in other sections. The business owner should not need to calculate anything manually.

Filters: by product (dropdown — All Products or specific product) and by date range (Today, This Week, This Month, Custom).

The 10 Core Metrics — Definitions and Formulas

Total Orders Generated

Count of all orders received in the selected period across all sources — order form, manual entry, CSV upload.

Total Orders Delivered

Count of orders with delivery status marked as Delivered. Revenue is only counted on delivered orders.

Delivery Rate

$(\text{Total Delivered} \div \text{Total Generated}) \times 100$. Displayed as a percentage. Colour-coded — green above target, amber approaching threshold, red below minimum.

Average Order Value (AOV)

$\text{Total sales value of delivered orders} \div \text{Total delivered orders}$. Only uses delivered orders — undelivered orders have not generated real revenue.

Platform CPA

$\text{Ad spend} \div \text{Total orders generated}$. This is what Facebook or any ad platform shows as the cost per order. Always displayed alongside Real CPA so the gap is visible.

Real CPA

$\text{Ad spend} \div \text{Total orders delivered}$. This is the true acquisition cost after accounting for failed deliveries. Always higher than Platform CPA. The gap between the two is shown explicitly.

Average COGS

Total cost price of all delivered orders ÷ Total delivered orders. Accounts for bundles and multi-unit orders — not just the single unit price.

Average Delivery Fee

Total delivery fees paid ÷ Total delivered orders.

Profit Per Order

AOV minus Real CPA minus Average COGS minus Average Delivery Fee. The single most important number on the dashboard.

Total Profit

Profit Per Order × Total Delivered Orders. Cross-checks against revenue minus all expense categories.

ROAS vs Business ROI — Always Separate

These are two different numbers and must always be displayed separately with clear labels. They must never be merged or one used as a substitute for the other.

ROAS

Return on Ad Spend. Total revenue from delivered orders ÷ Total ad spend. This is the advertising metric. A strong ROAS does not mean the business is profitable.

Business ROI

Total profit after all expenses (operational, building, marketing, advertising) ÷ Total investment. This is the real business metric. Always calculated and shown after all expense categories are applied.

Delivery Rate by Location

The dashboard already has a section for Delivery Rate by Location — Lagos vs Outside Lagos. This must show delivery performance separately for Lagos orders and outside-Lagos orders because the failure rate, cost, and logistics behaviour are significantly different between the two.

— SECTION 06 —

Expenses — Four Categories

Expenses must be split into exactly four categories. This separation is not cosmetic — it is what allows the business to calculate advertising ROAS independently, see operational cost as a percentage of revenue, and identify what to cut.

Category 1 — Operational Expenses

The daily cost of keeping the business running. These are recurring and expected. They feed directly into the overall P&L calculation.

- Logistics and delivery fees
- Automation and software subscriptions
- Office supplies and utilities
- Internet and communication
- Salaries and staff wages
- Customer service costs
- Packaging materials
- Platform fees and transaction charges

Category 2 — Building Expenses

One-off or infrequent spend on things that build assets. These should not happen often — if they are recurring they are likely misclassified.

- Software development and tech infrastructure
- Equipment and hardware
- Website, domain, and hosting
- Brand and design work
- Training and staff development
- Legal and registration fees
- Photography and content production

Category 3 — Marketing Expenses

The cost of marketing activities that are not direct ad spend. These are separated from advertising because they do not directly produce an order — they build awareness and brand.

- Content creation costs
- Influencer and creator fees
- Email and SMS marketing platform costs
- Organic social media production
- PR and press costs
- Sponsorships and partnerships

Category 4 — Advertising Expenses

Pure paid ad spend only. This category is tracked separately from all others so advertising ROAS can be calculated in isolation — before operational costs are applied — and then business ROI is calculated after all categories are applied.

- Meta ads spend — Facebook and Instagram
- Google Ads spend
- TikTok Ads spend
- Any other paid placement

— SECTION 07 —

Funnel Analytics — Per Funnel, Per Offer

This is one of the most important features in Numbatrak and it does not exist in any comparable Nigerian tool. A business can run multiple funnels on the same product — different price points, different ad angles, different platforms — and needs to see each one's performance separately.

How Funnels Work

Ad spend is recorded per source (TikTok, Facebook, Instagram), per product, and per specific funnel or offer within that product. One product can have multiple funnels. One funnel can have multiple offers.

Example from the meeting — 'Flusher' product, one month:

- Funnel 1: Discount offer — ₦1,500,000 ad spend
- Funnel 2: Normal offer — ₦1,054,000 ad spend
- Funnel 3: TikTok — ₦114,000 ad spend

Each funnel shows its own orders, delivery rate, CPA, and profit per order. The business owner can see whether a funnel is profitable even when the overall business is not, and vice versa.

What Each Funnel View Shows

- Funnel name and source (Facebook, TikTok, Instagram, etc.)
- Ad spend for this funnel
- Total orders generated from this funnel
- Total orders delivered from this funnel
- Delivery rate for this funnel
- Platform CPA for this funnel — $\text{ad spend} \div \text{orders generated}$
- Real CPA for this funnel — $\text{ad spend} \div \text{orders delivered}$
- Platform CPA vs Real CPA gap — shown explicitly

- AOV for this funnel
- Average COGS for this funnel
- Average delivery fee for this funnel
- Profit per order for this funnel
- Total profit from this funnel

Business vs Funnel Toggle

The user can toggle between two views at the top of the Performance section:

- Individual Funnel View — all metrics for one specific funnel or offer in isolation
- Business Total View — all funnels aggregated into one business-level performance picture

— SECTION 08 —

HR Dashboard Integration

The founder built a separate HR dashboard (on domain '2IBR') that manages staff records, payroll, attendance, strikes and stars, leaderboard, complaints, and leave management. The decision made in this meeting is to rebuild it into Numbatrak — not via API — as per-tenant functionality.

"Because Numbatrak is going multi-tenant, HR features must exist per tenant. Each organisation gets its own HR layer. The existing HR code is a guide — not a copy-paste."

Why Not API Integration

An API sync would keep both systems alive and mirror data between them. This creates two codebases to maintain and data that is only reflected rather than native. Since Numbatrak is going multi-tenant, each organisation needs its own HR data isolated by RLS — just like every other data type in Numbatrak. Building it as a native module is the correct architectural decision.

HR Features to Rebuild into Numbatrak — Incrementally

These are rolled out one at a time, not all at once. Order of priority from the meeting:

6. Staff records and salary — base salary and commission per staff member
7. Payroll — total monthly salary cost, paid or unpaid status per staff
8. Attendance — staff attendance logging
9. Stars and strikes — performance record per staff member
10. Leaderboard — staff ranked by performance metrics
11. Complaints dashboard — customer complaints logged, assigned, and tracked
12. Feedback — customer and internal feedback records
13. Leave management — staff on leave auto-marked absent, no orders assigned, no query raised, payslip still visible

HR + Numbatrak Connection

Once the HR module is rebuilt into Numbatrak, delivered customers from the order management system auto-populate the call and complaints queue. No more manual CSV export and bulk import — the customer data flows directly from orders into the CRS (customer relations) workflow.

Staff CRS performance — commissions earned, complaints handled, feedback received — connects to the business profitability view so the founder can see human performance and business performance in one place.

— SECTION 09 —

Phase 1 — Stabilisation Tasks

Phase 1 is the current contract scope. Target: end June / early July 2026. The goal is to make everything that already exists work correctly — not to add major new features.

TASK · DETAIL · PRIORITY

Email integration	Wire email platform (SendGrid or Brevo). Emails currently do not work at all. This is a blocker for order confirmations, member invites, and forgot-password.	Critical
Forgot-password flow	Not implemented at all. Must be built alongside email integration.	Critical
Navigation restructure	Implement the new grouped sidebar as defined in Section 03. Rename, merge, and remove tabs as specified.	Critical
Delivery Analytics page	Merge Summary tab and Waybill Statistics tab into one Delivery Analytics page as defined in Section 03.	High
Wallet page	Rename Remittance to Wallet. Build the remittance tracking flow as defined in Section 04.	High
Dashboard metric accuracy	Review every metric on the dashboard against the formulas in Section 05. The figure currently labelled 'profit' is actually revenue. Correct all labels and calculations.	Critical
Agent deactivation	Add deactivate option to agents (not just delete). Deactivated agents stop receiving orders but their history is preserved.	High

Product deactivation	Add deactivate option to products (currently only edit and delete exist).	High
Order form UI	Remove duplicate preview and redundant third column. Form functionality is confirmed working — UI only needs cleanup.	Medium
Abandoned cart — verify	The abandoned cart feature exists but its behaviour is unclear. Verify it works end-to-end and document how it functions.	High
Dashboard — show brand name	Home screen should display the store/brand name, not 'Numbatrak'. Clicking the brand name goes to the homepage.	Medium
Terms of Service and Privacy Policy	Currently missing entirely. Must be added before any external users are onboarded.	Critical
Sample/test data cleanup	Delete sample and test data from the database once the developer confirms multi-tenant isolation is working correctly.	High

— SECTION 10 —

Phase 2 — Public Feature Build

Phase 2 requires a contract extension. Target: mid-August 2026. These are the features required before any external paying users are onboarded.

TASK · DETAIL · PRIORITY

RBAC — Role-Based Access Control	Feature access governed by subscription tier. Users on lower plans who try to access a higher-tier feature see an upgrade prompt, not an error.	Critical
Subscription plans and billing	Subscription tiers (Starter, Growth, Pro). Per-plan feature limits — number of agents, CRS staff, admin users. Paystack recurring billing. Monthly and annual options.	Critical
Multi-company management	One account managing multiple brands or companies based on plan. Each company is a separate tenant with its own isolated data.	Critical
Super-admin dashboard	Internal admin view for the Numbatrak team. Manage all organisations, deactivate/revoke accounts, monitor platform activity, view churn and platform revenue. See the Super-Admin Infrastructure document for full spec.	Critical
Funnel Analytics section	New Performance section with funnel-level tracking as defined in Section 07. Per funnel: ad spend, orders, delivery rate, platform CPA, real CPA, profit per order.	Critical
Business Analytics section	Business-level aggregated view. ROAS vs Business ROI as two separate	Critical

	labelled numbers. Total profit after all expense categories.	
Invoicing section	Auto-generate invoice per order. PDF and WhatsApp shareable. Paid, unpaid, partially paid status tracking.	High
Accounting section	Business financial summary connecting revenue, all four expense categories, and net profit in one view.	High
HR module — incremental	Rebuild HR dashboard into Numbatrak as per-tenant functionality. Roll out incrementally: staff and salary first, then payroll, attendance, stars/strikes, leaderboard, complaints, feedback, leave.	High
Public landing page	Marketing page with pricing, feature overview, waitlist or signup CTA, and 'coming soon' feature section. Separate from the app itself.	High
Support system	In-app chat support and email support ticketing before external users are onboarded. WhatsApp support number.	High
SMS integration	Integrate Termii for SMS notifications (order confirmations, delivery updates, alerts).	Medium
WhatsApp notifications	Order confirmation, delivery update, and failed delivery alert via WhatsApp. After SMS is live.	Medium
Payment gateway for paid orders	Integrate Paystack (or similar) for online paid order checkout on the order form — in addition to COD.	Medium

— SECTION 11 —

What Is Missing — Full Gap List

These are features that are not in the current build at all and must be added. They emerged from comparing the current sidebar, the meeting discussion, and the full feature map.

Missing — Required Before Public Launch

- **Funnel Analytics** — per funnel ad tracking, platform CPA vs real CPA, delivery rate per funnel, profit per funnel
- **Business Analytics** — business-level ROAS vs business ROI as two separate numbers
- **Wallet** — money-in tracking with remittance confirmation flow for COD
- **Invoicing** — auto-generated invoices per order, PDF, WhatsApp shareable
- **Accounting** — financial summary view connecting all revenue and expense categories
- **RBAC** — subscription-tier-based feature access control
- **Subscription plans and billing via Paystack**
- **Super-admin dashboard** — platform management view for the Numbatrak team
- **Forgot-password flow**
- **Working email** — order confirmations, member invites, dunning
- **Terms of Service and Privacy Policy**

Missing — Required for Full Feature Parity

- **HR module built into Numbatrak per tenant** — staff, payroll, attendance, stars/strikes, leaderboard, complaints, leave
- **Agent deactivation** (not just delete)
- **Product deactivation** (not just delete)
- **Damaged products category** — move damaged stock separately so it does not inflate live inventory value
- **Transfer products between agents**
- **Delivery rate by location** — Lagos vs outside Lagos already started on dashboard, needs to be completed

- Customer source attribution — where each customer came from (Facebook, TikTok, Instagram, organic) for ad optimisation
- SMS notifications via Termii
- WhatsApp notifications for orders and delivery updates
- Abandoned order recovery — verify it works and complete the back-end wiring

Missing — Post-Launch / Future

- Meta Ads API direct connection — removes need for manual ad spend entry (post 1,000 paying users)
- Google Ads integration (post 1,000 paying users)
- TikTok Ads integration (post 1,000 paying users)
- Predictive analytics — predict revenue from planned ad spend (future vision)
- Facebook Pixel and Conversion API on the order form storefront (developer has already prototyped this — it works)
- Advanced accounting — P&L statements, balance sheet, cash flow, bank reconciliation (future vision)
- Barcode generator for inventory labelling (post 1,000 users)
- Customer segments and re-engagement campaigns (post 1,000 users)

— SECTION 12 —

Recommended External Integrations

These are the third-party services the developer flagged as required. None are live today except the Supabase database.

Email	SendGrid or Brevo. Either works. Must be integrated in Phase 1 — emails are a Phase 1 blocker. Needed for: order confirmations to customers, member invite emails, forgot-password, dunning emails for failed subscription payments.
SMS	Termii (T-E-R-M-I-I). Nigerian-focused SMS platform. Phase 2. Needed for: order confirmation SMS, delivery update SMS, OTP authentication.
Payment gateway	Paystack. Phase 2. Needed for: paid order checkout on the order form (as an alternative to COD), and Numbatrak's own subscription billing.
Meta Pixel + Conversion API	Facebook Ads Pixel ID and Conversion API. The developer has already prototyped this and it works. Phase 2. Needed for: customer source attribution on the order form so brands know which ad drove each order.

Technology Stack Confirmed

- Front-end: React single-page application
- Database: Supabase (managed PostgreSQL)
- Auth and security: Supabase Auth with Row-Level Security on every table
- Email: SendGrid or Brevo (to be selected)
- SMS: Termii
- Payments: Paystack (subscriptions and order payments)

This document is produced from the June 2026 product strategy and technical planning meeting. All decisions and action items are recorded in the meeting summary document. This brief is the implementation reference for the developer.

Numbatrak Developer Brief · June 2026 · Confidential
