

NUMBATRAK

Feature Specification

The build reference — feature by feature

Working draft. This document is written as each feature is walked and confirmed. It grows section by section. Every confirmed decision, judgment call, and small detail is captured here so nothing lives only in conversation.

LOCKED IN THIS DRAFT

- **1. Orders** — The order page — how orders are tracked, edited, and moved through delivery
- **2. Inventory** — Per-agent stock, transfers, and damage/loss tracking
- **3. Dashboard** — The 10 metrics, the two views, filters, alerts, and the loss panel
- **4. Payroll** — The flexible pay engine — components, gates, tiers, the live earnings view, and the payment run
- **5. Wallet** — COD remittance — agent-per-day cash tracking, net-off, and the cash gap
- **6. Accounting** — The consolidated P&L and cash view across all sub-brands, with heavy bookkeeping parked
- **7-11. Staff Management** — Staff, Attendance, Strikes, Stars & Leaderboard, and Leave — the settable people suite
- **12-14. Delivery** — Waybills, Agents (external delivery partners), and Delivery Analytics with the balance roll-up
- **15-17. Order Intake** — Order Forms, Abandoned Carts, and Follow-Ups with CRS follow-up timing
- **18-20. Products & Finance** — Products (parent, variants, offers), Expenses, and Invoicing
- **21. Media Buyers** — The full advertising subsystem — production, ad catalog, spend, and performance analytics
- **22. Customer Management (CRM)** — The full customer subsystem — database, feedback calls, complaints, more purchase, and automations
- **23. Storefront** — The multi-tenant e-commerce shop — store, funnel mode, discounts, checkout, attribution
- **24. Settings** — The self-serve account layer — profile, subscription logic, billing, team, data

STILL TO WALK

The shared cross-cutting layers (Notifications, Messaging & Integrations) and the remaining lighter features. Each will be added to this document as it is confirmed.

HOW TO READ THIS DOCUMENT

Each feature is walked in four layers: **Screens** (the pages), **Actions** (every button), **States** (empty, loading, full, error, success), and **Rules** (what happens behind each action). The tiny parts hide in the last two layers.

Three kinds of boxes appear throughout:

LOCKED RULE A rule that is settled and non-negotiable for the build.

CONFIRMED DECISION A decision the founder confirmed during the walk — the reasoning is recorded so it is not re-litigated.

TINY PART A small but important detail that is easy to miss and would break the feature if forgotten.

GOVERNING PRINCIPLE — SETTABLE BY DEFAULT

Numbatrak is a public SaaS serving many businesses that operate differently. So a standing rule runs through the whole spec: anywhere there is a time window, a threshold, a rate, a limit, or a default value, it is settable per business unless there is a specific reason it cannot be. Examples like the feedback-call window (3 days after delivery), strike thresholds, commission rates, gate ratios, and low-stock levels are all defaults a business can change. When the spec states a number, read it as a default, not a hard-coded constant.

1. Orders

Status: **Locked** — partly built, extended for launch

The Orders page is the heart of the system. It reflects every order coming through the business — COD or paid — and is where the business owner and CRS track orders from placement through delivery. Almost every other number in Numbatrak feeds off what happens here. This section covers the Orders sub-tab only; Order Forms, Abandoned Carts, and Follow-Ups are separate sub-tabs documented elsewhere.

LAYER 1 Screens

- **Orders list** — Products as the list — all orders, sectioned by month, newest month on top. A 'JULY 2026' header sits above that month's orders.
- **Order detail and edit** — Opens when you tap any order. Shows the full order and its action buttons.
- **Manual entry** — A form for orders taken by Instagram DM, WhatsApp, phone, or walk-in.

LAYER 2 Actions

1. **New order** — opens the manual entry form.
2. **Open order** — tap any row to see detail and edit.
3. **Mark delivered** — auto-fills the delivery date, drops inventory from the delivering agent, and (from Q3) fires a WhatsApp delivery update to the customer.
4. **Add upsell to order** — adds an extra product or quantity to an existing order. Records the extra revenue and feeds the CRS upsell bonus.
5. **Mark failed delivery** — sets the status to Failed and logs the delivery expense in one action, directly from the order.
6. **Add note** — free-text note that stamps the date automatically when saved.
7. **Edit order** — change customer, product, quantity, price, or agent — even on a delivered order.
8. **Advance status** — moves the order through new, confirmed, packed, dispatched, delivered.
9. **Filter** — by status, year, month, product, agent, funnel, sub-brand, and date range.

LAYER 3 States

- **Empty** — No orders yet — an invitation to create the first order or embed an order form. Not an error.
- **Loading** — Skeleton rows while the month's orders load.
- **Full** — Month-sectioned rows, newest month first, each showing customer, product, funnel, location, agent, status, and price.
- **Save failed** — Keeps everything the user entered, shows what to fix, never discards input.
- **Saved** — The new order appears under its month and a short confirmation toast shows.
- **Failed delivery** — Red status, expense logged, and it counts against the delivery rate on the dashboard.

LAYER 4 Rules

LOCKED RULE Inventory drops when an order is marked Delivered — never when it is placed. This is the founding logic of the whole stock model.

LOCKED RULE The delivery date auto-fills the moment status becomes Delivered. No manual date entry, which removes a whole class of human error.

LOCKED RULE Sales profit before ads is shown per order: sales price minus COGS minus delivery fee. This is the profit figure before advertising is considered.

LOCKED RULE Role scope: a CRS sees only their own orders; a manager sees their team's; an admin sees everything including money.

LOCKED RULE Every order carries its funnel/offer tag so the Performance section can isolate advertising ROI per offer.

LOCKED RULE A delivered order flows the customer automatically into the CRM customer database. No manual customer upload, ever.

LOCKED RULE Every order carries a 'who received the money' flag — agent (collected COD on our behalf), company account (customer paid us directly), or prepaid. This flag is set at entry or delivery and decides whether the order creates an agent remittance line when it is marked delivered. It is the switch that routes an order into Wallet or not.

Confirmed decisions

CONFIRMED DECISION Mark delivered fires a WhatsApp update to the customer — but this is a Q3 capability. For launch, marking delivered sets status, auto-fills the date, and drops inventory; the WhatsApp fire is added when the integration lands.

CONFIRMED DECISION The person who adds an upsell in the order tab is the CRS who gets the upsell-bonus credit. The in-order upsell feeds both the order's revenue and that CRS's monthly upsell bonus in payroll.

CONFIRMED DECISION Status pipeline is new → confirmed → packed → dispatched → delivered, with failed, returned, and lost as terminal branches. This merges the storefront's simpler pipeline with the COD reality.

Tiny parts

TINY PART Editing an already-delivered order changes what was edited, and it flows through. Fix the sales price on a delivered order and the profit math, the dashboard, and the analytics all update to match. A delivered order is not frozen — the data stays truthful to the correction.

TINY PART The order list is sectioned by month with a month header (e.g. 'JULY'). When a new month begins, a new section appears at the top.

TINY PART The CRS can mark a failed delivery and its expense directly in the order tab — the expense is captured at the same moment, not in a separate step.

TINY PART Notes stamp the date automatically when updated, so there is always a record of when something was noted.

TINY PART The 'who received the money' flag is what connects Orders to the cash side of the business. When an order is marked delivered: if the flag is 'agent', a remittance line is created in Wallet; if it is 'company account' or 'prepaid', no remittance is created because the money is already in hand. This single flag is why the cash numbers reconcile end to end.

2. Inventory

Status: **Locked** — partly built, extended for launch

Stock is held per-agent, not in one central pool. Each delivery agent holds stock; the warehouse is itself an agent — a holder that keeps stock but does not deliver. When an agent delivers an order, stock deducts from that agent's holding. This single idea makes the whole flow coherent: stock always lives with a holder, and every movement is traceable to an agent.

LAYER 1 Screens

- **Stock grid** — Products as rows, agents (including the warehouse) as columns, holdings in the cells. A total per product and a cost-of-inventory footer valuing every agent's holdings at cost price.
- **Transfer** — Move stock from one agent to another, with a required reason.
- **Adjust** — Mark stock damaged or missing against a specific agent, with a required reason.

LAYER 2 Actions

10. **Transfer stock** — pick from-agent, to-agent, product, and quantity. Reason required.
11. **Mark damaged** — reduces that agent's stock and records it as a loss. Reason required.
12. **Mark missing** — same as damaged but tracked separately. Reason required.
13. **Filter** — by product, sub-brand, location, and agent.
14. **Low-stock threshold** — set the number that triggers a low-stock alert.
15. **View movement history** — every waybill-in, delivery-out, transfer, and adjustment for an agent, dated and attributed.

LAYER 3 States

- **Empty** — No products yet — add products first, then waybill stock to agents.
- **Loading** — Skeleton grid while holdings load.
- **Full** — Grid of agent columns with live holdings.
- **Low stock** — A cell turns red below its threshold and an alert fires.
- **Transfer blocked** — Cannot move more than the from-agent holds, or the reason is missing.
- **Adjusted** — Stock drops and the movement is logged with reason and date.

LAYER 4 Rules

LOCKED RULE The warehouse is an agent. It holds stock like any other agent; it just does not deliver.

LOCKED RULE A delivery deducts from the delivering agent's stock, not a central pool. This ties directly to the Orders 'inventory drops on delivered' rule.

LOCKED RULE A waybill-in adds stock to the receiving agent, and the waybill cost flows to expenses.

LOCKED RULE Damaged and missing both require a reason and are tracked separately from sold stock.

LOCKED RULE Cost of inventory equals every agent's holdings multiplied by cost price, summed across all agents.

LOCKED RULE Stock can never go negative — you cannot transfer or adjust more than an agent holds.

LOCKED RULE Every movement is dated and attributed to whoever did it. The movement history is the control that keeps self-service adjustment honest.

Confirmed decisions

CONFIRMED DECISION Transfers are usually regional (same location), but can go cross-region — for example Lagos to Abuja — in special circumstances. Cross-location is allowed, not blocked; the reason note carries the justification.

CONFIRMED DECISION Movement history is included: a full per-agent audit trail of every waybill-in, delivery-out, transfer, and adjustment, dated and attributed.

CONFIRMED DECISION Both CRS and manager can manage stock numbers, transfers, and adjustments, and both receive low-stock updates. This is self-service, not admin-only; the movement log provides the oversight.

Tiny parts

TINY PART Damaged and missing stock does NOT auto-flow to expenses. Marking something damaged is a judgment call, and auto-posting it as a loss would let stock adjustments silently move the profit number. Damage/loss reduces the agent's stock and appears in shrinkage reporting, but only becomes an expense if the owner records it deliberately. This keeps the profit number honest.

TINY PART Transfers and adjustments both require a written reason before they can be saved — the same discipline applies to moving stock and to writing it off.

3. Dashboard

Status: **Locked** — **partly built, extended for launch**

The dashboard is the brain of the product. It is not a static screen — it is a filterable engine. Every metric recalculates when a filter changes. It has two views: a funnel-level view that shows advertising in isolation, and a business-level view that layers in all operational expenses to show the true health of the business. It also carries a 'what you're losing' panel so failed orders are seen, not hidden.

LAYER 1 Screens

- **Funnel-level view** — The 10 core metrics for one funnel or offer — advertising in isolation (ROAS, CPA, product cost, and the profit built from them).
- **Business-level view** — Layers in all operational expenses to show overall business health and true ROI, with ROAS and Business ROI shown as two separate numbers.
- **Red-flag alerts** — Six watchers firing against owner-set thresholds.
- **Loss panel** — A dedicated 'what you're losing' panel showing the money and diagnostics behind non-delivered orders.

The 10 core metrics

16. **Total orders generated** — count of all orders in the period.
17. **Total orders delivered** — count of orders with status Delivered.
18. **Delivery rate** — $\text{delivered} \div \text{generated}$, as a percentage, with colour indicator.
19. **Average order value** — $\text{total sales value of delivered orders} \div \text{delivered count}$. Delivered orders only.
20. **Platform vs Real CPA** — Platform CPA is $\text{ad spend} \div \text{generated}$; Real CPA is $\text{ad spend} \div \text{delivered}$. The gap is the hidden acquisition cost. Filterable by ad platform.
21. **Average COGS** — $\text{total cost price of delivered orders} \div \text{delivered count}$. Accounts for bundles.
22. **Average delivery fee** — $\text{total delivery fees} \div \text{delivered count}$.
23. **Profit per order** — AOV minus Real CPA minus COGS minus delivery fee. The single most important number.
24. **Total profit** — $\text{profit per order} \times \text{delivered orders}$.
25. **ROAS vs Business ROI** — two clearly separate, labelled numbers — never merged.

LAYER 2 Actions

26. **Filter everything** — status, year, month, product, funnel, agent, source, sub-brand, date range, and ad platform. Every metric recalculates. Time frames include today, weekly, monthly, and custom dates.
27. **Toggle view** — switch between funnel-level and business-level.
28. **Tap a metric** — opens the plain-language explainer — the profit waterfall, the ROAS-vs-ROI split-screen, or the pricing assistant.
29. **Set alert thresholds** — the owner defines what counts as a red flag; sensible defaults ship out of the box.
30. **Delivery rate by location** — see which areas sell better and which fail.

LAYER 3 States

- **Empty** — No data yet — guides the owner to add orders and (if they run ads) ad spend.
- **Loading** — Metric skeletons while it recalculates.
- **Healthy** — Green tonation across metrics.
- **Warning** — Amber or red tonation, with alerts surfaced at the top.
- **Filtered to nothing** — No orders match the filter — shows a clean zero state, not a broken screen.
- **No ad spend** — A business with no ad spend is a valid state, not an error. CPA and ROAS simply do not apply, and the dashboard shows the profit picture without them.

LAYER 4 Rules

LOCKED RULE Every profit metric uses delivered orders, not generated — undelivered orders have earned nothing.

LOCKED RULE The dashboard is a filterable engine: every metric recalculates on any filter change. It is never a static view.

LOCKED RULE ROAS and Business ROI are never merged. They are always two separate, clearly labelled numbers.

LOCKED RULE Colour tonation follows health against the owner's targets: good is green, mid is amber, critical is red. The same thresholds drive both the colour and the red-flag alerts.

LOCKED RULE Real CPA uses delivered orders; Platform CPA uses generated orders. The gap between them is the hidden cost the ad platform does not show.

LOCKED RULE All numbers pull automatically from orders, inventory, expenses, and ad spend. There is no manual dashboard data entry.

LOCKED RULE Role-scoped: a CRS sees their own numbers, a manager sees the team's, an admin sees all money.

LOCKED RULE Alerts fire to the notification bell now; WhatsApp and email delivery come in Q3.

The 'what you're losing' panel

Non-delivered orders are not thrown away. They are a loss the owner needs to see. This dedicated panel puts the leak on the table. It obeys all dashboard filters and recalculates like every other view.

HEADLINE — THE MONEY

- **Orders not delivered** — count of orders that did not deliver, out of orders generated.
- **Would-be sales value** — the total value those orders would have brought.
- **Ad spend on them** — the advertising spend attributable to them (see the estimation note below).
- **Failed-delivery cost** — the cost of delivery attempts that did not land.

- **Real cost per failed order** — ad spend plus attempt cost, divided by failed orders — the number that makes the loss concrete.

DIAGNOSTIC — WHERE THE LOSS CONCENTRATES

- **By location** — which areas fail most (the loss side of delivery-rate-by-area).
- **By agent** — which agent has the worst delivery rate.
- **By funnel** — whether a funnel pulls in orders that never land — a good CPA with a bad delivery rate is a trap.
- **By reason** — of the non-delivered, how many are failed, returned, lost, or still pending — because pending may still deliver, failed may be recoverable with a follow-up call, and lost is gone.

Confirmed decisions

CONFIRMED DECISION Alert thresholds are owner-set with sensible defaults shipped out of the box (for example, delivery rate below 65%, CPA up more than 15% week-on-week). The owner can change them in settings.

CONFIRMED DECISION A business with no ad spend is fully supported. Metrics that need ad spend (CPA, ROAS) simply do not appear rather than nagging for a number that is not relevant. The profit picture — COGS, delivery, profit per order — still shows.

CONFIRMED DECISION Colour tonation and red-flag alerts run off the same owner-set thresholds. One setting drives both the colour of a metric and whether it raises an alert. Good is green, mid is amber, critical is red.

Tiny parts

TINY PART Ad spend on failed orders is an ALLOCATION, not a trace. Ad platforms do not tell you which specific order a given naira of spend bought, so this number is estimated: total funnel spend is spread evenly across the orders it generated (this is the Platform CPA), and the failed orders each carry that average share. It answers 'on average, what did the orders that failed cost me to generate and attempt' — the useful business question — but it does not follow individual naira. This figure should be shown with an 'estimated' marker so it is never mistaken for an exact trace.

TINY PART The allocation assumes failed orders cost the same on average to acquire as delivered ones. When a funnel genuinely attracts worse-quality orders that fail more often, this slightly understates the true loss. The assumption is noted so the number is never treated as gospel.

TINY PART Platform vs Real CPA is filterable by ad platform, so Meta, TikTok, and Google spend and their resulting CPAs can each be seen separately.

4. Payroll

Status: **Locked — partly built, extended for launch**

Payroll is the deepest money logic in the product, so it is built as a flexible engine rather than one hard-coded formula. Every business pays staff differently — some pay a fixed salary only, some pay straight commission, some gate commission behind performance. Numbatrak handles all of them by composing each person's pay from toggleable components. QuickBuy's own structure — base, gated commission, upsell, and Star of the Month — is simply one configuration of that engine. Numbatrak calculates pay; it does not disburse it. Money is paid outside the system and marked paid here.

LAYER 1 Screens

- **Pay structure** — Per staff member (or role as a tier), toggle which pay components apply and set their amounts.
- **Calculation trace** — For any person any month, the full line-by-line breakdown of how their pay was built.
- **Payment run** — The month's payroll for everyone: calculate, review, override, and mark each as paid.
- **Live earnings view** — What each staff member sees of their own pay — building in real time through the month, with gate status.

The pay components

A staff member's pay is assembled from these components. Each is toggled on or off per person or per role (a 'tier'). A fixed-salary employee has only base on; a performance CRS has several on.

- **Base salary** — fixed monthly amount. Always safe — no gate ever touches it.
- **Commission** — on/off. If on, choose the basis — flat per delivered order (e.g. ₦500/order) OR percentage of sale (e.g. 5% of each delivered order's value) — then set the rate. An optional delivery-rate gate can sit on top (see below).
- **Upsell bonus** — on/off. A set amount per upsell the person adds. Never gated — always earned.
- **Star of the Month** — on/off. A bonus if the person wins Star of the Month.
- **Manual adjustment** — plus or minus, entered by admin — a reimbursement, a deduction, a one-off. Always available and reversible.

The gates — both optional

Gates are how a business ties pay to performance. Both are optional and off by default; a business with no performance gating never turns them on.

- **Commission gate (delivery rate)** — an optional modifier on top of commission. If on, the manager sets a delivery-rate threshold (e.g. 65%). If the staff member's own delivery rate for the month is below it, the whole month's commission zeroes — not reduced, zero. Upsell and base are untouched.
- **Manager gate (team ratio)** — an optional gate on the manager's own bonus. If on, the manager earns their bonus only if at least a set percentage of their team hit their KPI that month. Default is 50%, and it is settable.

LAYER 2 Actions

31. **Toggle a pay component** — base, commission, upsell, SOTM, and others, on or off per person or role.

32. **Set commission basis** — flat per order or percentage of sale, then enter the rate.
33. **Set the commission gate** — optional; if on, set the delivery-rate threshold.
34. **Set the manager gate** — optional; if on, set the % of team that must hit KPI (default 50%).
35. **Run payroll** — calculate everyone's pay for the month from live data.
36. **Override a line** — edit any payroll line; base and commission overrides allowed. The override sticks by intent but is reversible.
37. **Mark paid** — flag each person paid once paid outside the system. A paid line stays editable and can be re-sent.
38. **View trace** — open any person's full calculation breakdown.

LAYER 3 States

- **Empty** — No pay structures set — guide the owner to set them per staff first.
- **Calculating** — Pulling delivered orders, upsells, and gate checks from live data.
- **Calculated** — Everyone's pay built, ready to review.
- **Gate missed** — Commission zeroed, shown clearly with the reason (rate below gate).
- **Overridden** — An edited line is flagged as manually adjusted, and can be reverted to the calculated figure.
- **Paid** — Marked paid; the notification and payslip fire; the line remains editable and re-sendable.

LAYER 4 Rules

LOCKED RULE Pay is composed of toggled components — one engine, and each business turns on the parts it uses. QuickBuy's structure is one configuration, not a hard-coded rule.

LOCKED RULE Base salary is always safe. No gate ever touches it.

LOCKED RULE Commission and its gate are two separate switches. Commission can be paid straight (per order or percentage) with no gate at all; the delivery-rate gate is an optional modifier on top.

LOCKED RULE Commission has a basis: flat per delivered order, or percentage of the delivered sale value. The business picks which.

LOCKED RULE When the commission gate is on and missed, the whole month's commission zeroes — not reduced. Upsell and base are untouched.

LOCKED RULE Upsell is never gated — earned regardless of whether commission unlocks.

LOCKED RULE Both gates are optional. A business with no performance gating turns them off.

LOCKED RULE The manager gate is a team ratio — default 50% of the team hitting KPI, and it is settable.

LOCKED RULE Numbatrak calculates, it does not disburse. Pay is paid outside the system, then marked paid here.

LOCKED RULE Every line is editable — base and commission overrides allowed. An override sticks by intent but is always reversible to the calculated figure.

LOCKED RULE Marking paid does not hard-lock the month. A paid line can be edited and re-sent if there was an error.

LOCKED RULE Every figure pulls from live data — delivered orders, upsells, and delivery rate come straight from Orders.

The live earnings view

Performance-tied staff see their own pay building in real time through the month — not just at payroll run. This is a motivator: a CRS watching their commission climb, and seeing exactly where their delivery rate sits against the gate, has a reason to push while there is still time to fix it.

- **What they see** — their pay so far this month — base, commission earned, upsells, on-track total.
- **Gate status** — their delivery rate against the gate threshold, with a clear message: how far below the gate they are and how much commission it would unlock to cross it.
- **Scope** — a staff member sees only their own pay, never anyone else's. This follows the role-scoping rule — CRS sees own, manager sees team, admin sees all.

Confirmed decisions

CONFIRMED DECISION The commission gate is measured on the individual staff member's own delivery rate for the month — their own performance gates their own commission, not the team's rate.

CONFIRMED DECISION Commission and the delivery-rate gate are separate switches. Many businesses pay straight commission (flat or percentage) with no gate; only businesses that want performance gating turn it on. Commission is never forced to be gated.

CONFIRMED DECISION The live earnings view exists specifically so performance-tied staff see how they are doing in real time, mid-month, rather than being surprised at payroll run. It shows their number climbing and their gate status live.

CONFIRMED DECISION Staff are notified when marked paid — a bell notification and email with their payslip. The notification itself is routed through the shared notification system (documented in its own cross-cutting section), not built separately inside Payroll.

Tiny parts

TINY PART An override sticks through a re-run rather than being silently wiped, because an override is deliberate. But it is always reversible — the line can be reset to the calculated figure at any time. Re-running payroll warns before it would replace an override rather than doing so silently.

TINY PART Marking a staff member paid does not lock their month. The line stays editable, and the payslip can be re-sent if a correction is made after payment.

TINY PART The commission gate zeroes commission entirely at the threshold — there is no partial or sliding scale. A staff member one delivery below the gate loses the whole month's commission. This is deliberate and must be shown plainly in both the trace and the live earnings view so it is never a hidden surprise.

5. Wallet (Remittance)

Status: **Locked** — new for launch

Wallet is where COD cash is tracked from the moment an agent collects it to the moment it reaches the business. For a cash-on-delivery business this is the difference between revenue earned and cash actually in hand — money a delivery agent has collected but not yet paid in is earned, but it is not yet yours. Wallet makes that gap visible per agent, and it is the source the Accounting feature reads for the cash position.

LAYER 1 Screens

- **Remittance day** — Each agent's deliveries for the day compiled into one line, with the expected remittance and a mark-remitted button.
- **Net-off** — The same line when the business owes the agent back; the amount they remit nets both directions.
- **Accountant oversight** — Marked remittances notify the accountant, who reviews and confirms externally.

LAYER 2 Actions

39. **Mark remitted** — the manager marks an agent's day paid in, recording the amount that actually came in.
40. **Record what came in** — if less than expected arrives, record the actual amount; the shortfall stays standing against that agent.
41. **Record what you owe the agent** — when the business owes the agent (e.g. a failed-delivery trip the agent covered), record it as an expense — you pick the category, exactly as if entering any expense — and it nets off the remittance.
42. **Filter** — by agent, day, sub-brand, and standing vs remitted.

LAYER 3 States

- **Nothing due** — No deliveries yet today where the agent collected — no remittance owed.
- **Standing** — The agent holds the cash; not yet remitted.
- **Remitted** — Marked paid in; the accountant is pinged to review.
- **Short** — Less came in than expected; the shortfall stays owed against the agent.
- **Net owed to agent** — The business owes the agent more than they collected; the balance carries forward.

LAYER 4 Rules

LOCKED RULE The unit is agent-per-day. All of an agent's deliveries in a day where the agent collected the money compile into one remittance line.

LOCKED RULE Expected remittance = delivered value minus delivery fee (which the agent keeps) minus anything the business owes the agent. It nets both directions.

LOCKED RULE The delivery fee comes from Orders. Wallet reads it to compute the expected amount; it does not re-book it as an expense.

LOCKED RULE Only orders flagged 'agent collected' create a remittance line. Orders paid to the company account directly, or prepaid, never enter the remittance flow — the money is already in hand.

LOCKED RULE Standing until remitted: outstanding cash sits with the agent until the manager marks it in.

LOCKED RULE Shortfall stays standing: if less comes in than expected, the difference remains owed. Nothing disappears.

LOCKED RULE Manager marks remitted; the accountant oversees. Every mark pings the accountant, who reviews and confirms in the business's own chats — she does not approve inside the app. It is not a blocking gate.

LOCKED RULE Failed deliveries go to expenses, not here. No cash was collected; the failed-attempt cost is a day-to-day operational expense, recorded and traceable.

LOCKED RULE Outstanding remittance is the cash gap. Earned revenue minus remitted equals money still in the field. Accounting reads this for the cash position.

Confirmed decisions

CONFIRMED DECISION When an agent remits less because the business owes them back, that deduction must be stated on the remittance line, recorded as an expense (in a category the user picks, usually Operational — it feels exactly like recording an expense), and fully traceable. It is never a silent subtraction; the money the agent covered is a real cost that appears on the expense sheet.

CONFIRMED DECISION The accountant does not approve remittances inside Wallet. The manager marks remitted; the accountant is pinged, then reviews and confirms in the business's chats, checking against the bank statement externally. The ping is kept — it is important that she knows to review.

CONFIRMED DECISION Whether an order creates a remittance is driven by the 'who received the money' flag on the order (agent / company account / prepaid), not by whether it is COD. Money reaching the company account directly can still be a COD-timed order; what matters is that the agent did not collect on the business's behalf.

Tiny parts

TINY PART Money reaching the company account directly does not mean the order is not COD — it means the agent did not collect on the business's behalf. The distinguishing axis is 'did the agent collect for us', not 'COD versus paid'.

TINY PART For an order the agent did not collect (paid to company, or prepaid), there is nothing to remit. The delivery fee for that order is simply recorded on the order and balanced there; it never enters the remittance flow. This keeps prepaid and direct-payment orders clean and out of Wallet entirely.

6. Accounting

Status: **Locked** — lighter version for launch

Accounting is the consolidated money view. It pulls income (from delivered orders and wallet) and expenses (from the four categories), categorises them, and shows the business's overall numbers — rolled up across all sub-brands, and drillable into any single sub-brand. It is deliberately the lighter version: a profit-and-loss and cash view, not a double-entry engine. The heavy formal bookkeeping stays in Zoho Books for now and is explicitly parked as future work.

LAYER 1 Screens

- **Consolidated P&L** — The whole business: total income, expenses by category, net profit, and expense-as-%-of-revenue.
- **By sub-brand** — The same P&L for each sub-brand on its own, with the group total on top.
- **Cash position** — Earned revenue against cash actually collected, with outstanding COD shown as the gap.
- **Parked for later** — The heavy bookkeeping, explicitly marked future / handled in Zoho for now.

LAYER 2 Actions

43. **Toggle view** — consolidated (whole business) or per sub-brand.
44. **Filter** — by time frame (today, weekly, monthly, custom), sub-brand, and expense category.
45. **Drill into a brand** — open any sub-brand's own full P&L.
46. **Export** — the P&L view for the period, for the accountant or Zoho.

LAYER 3 States

- **Empty** — No income or expenses yet this period — a clean zero P&L.
- **Loading** — Pulling income and expenses to roll up.
- **Full** — Consolidated P&L with the brand breakdown.
- **Loss** — Net negative shown plainly in red, not hidden.
- **Single brand** — One sub-brand's P&L in isolation.
- **Filtered to nothing** — No data for that filter — a clean zero, not a broken screen.

LAYER 4 Rules

LOCKED RULE It pulls, it does not ask for entry. Income comes from delivered orders and wallet; expenses come from the four categories. All of it is already in the system.

LOCKED RULE Income and expenses are categorised — income by source, expenses by operational, building, marketing, and advertising.

LOCKED RULE Consolidated and drill-down. Every sub-brand rolls up to the main business, and any one brand can be seen on its own. A business is one account with sub-brands beneath it.

LOCKED RULE Earned revenue uses delivered orders, consistent with the whole product. Undelivered orders are not income. This is the same revenue truth the Dashboard uses — there is only one revenue number across the product.

LOCKED RULE The cash position reads from Wallet. Cash in hand equals money paid to the company directly, plus prepaid, plus remitted COD. Outstanding equals only the COD still standing with agents. Earned minus outstanding equals cash in hand — the numbers reconcile end to end.

LOCKED RULE Filterable by time frame, sub-brand, and category, like every other view.

Confirmed decisions

CONFIRMED DECISION Accounting is the lighter version for launch — a profit-and-loss and cash view, not a double-entry engine. Zoho Books already handles the formal bookkeeping, so rebuilding it now would be wasted effort. The full engine is a future consideration, not a launch build.

CONFIRMED DECISION Accounting shows both earned profit and cash position together, because 'am I profitable and do I actually have the cash' is one question a founder asks at once. The cash line (collected vs outstanding) is drawn from Wallet, so the two views never contradict each other.

Parked for later — handled in Zoho Books for now

These are recorded here so the decision is not lost. When the business is ready to bring formal bookkeeping in-house, this is the build list:

- Chart of accounts
- Journals and double-entry (debits and credits)
- Vouchers routed to expense heads
- Suppliers module
- Balance sheet
- Cash flow statement
- Break-even calculator and tax provision
- Bank reconciliation
- Accounts payable and accounts receivable

Tiny parts

TINY PART Accounting's income must match the Dashboard's exactly — both use delivered-order revenue. If one counted generated orders while the other counted delivered, the same product would show two different revenue numbers, which destroys trust in every figure. There is one revenue truth.

TINY PART For a COD business, earned and collected are different moments. Accounting shows earned revenue as the profit picture and collected-vs-outstanding as the cash picture. The gap between them is uncollected COD sitting with agents — a number COD founders rarely see and badly need.

Staff Management

Payroll (feature 4) is the money engine of this group and is fully locked above. The features below are the rest of the Staff Management suite. Several already exist in the HR system that Numbatrak grew out of, so they are well understood; the important shift for the product is that rules which were hard-coded for one business become settable, so any business can configure them to their own way of working. The six-role model runs through all of them: CRS, Manager, Admin, Media, Accountant, Founder — with a multi-role union pattern where a person can hold extra roles and gets the combined access.

7. Staff

Status: **Locked** — exists in HR system

The people records that everything else references — pay structures, attendance, strikes, stars, leave, and delivery all key off a staff record.

LAYER 1 Screens

- **Staff list** — all people, filterable by brand and role.
- **Staff record** — personal details, role(s), bank details, and the link to their pay structure.
- **Add / edit staff** — create or edit a person.

LAYER 2 Actions

47. **Create staff** — add a person, set their primary role, add extra roles, assign sub-brand(s).
48. **Edit staff** — edit details, roles, brands, and bank details.
49. **Filter** — by brand and by role.

LAYER 3 States

- **Empty** — no staff yet — guide the owner to add the first person.
- **Full** — the roster, one row per person with role and brand.
- **Multi-brand** — a person covering more than one sub-brand shows under any brand they cover.

LAYER 4 Rules

LOCKED RULE Every staff member has one primary role plus optional extra roles. Access is the union of all roles held — a manager with an HR extra sees both the manager team-views and the HR admin-views.

LOCKED RULE The six-role model is CRS, Manager, Admin, Media, Accountant, Founder. This is the grouping used across the whole product.

LOCKED RULE Staff can cover multiple sub-brands — a primary brand plus extras — and appear under any brand they cover in filters and payroll.

LOCKED RULE Bank details live on the record and feed the Payroll payment run. Role-scoped: admins see all staff, managers see their team, everyone sees their own record.

8. Attendance

Status: **Locked** — exists in HR system · optional module

Self-marking staff attendance for meetings and check-ins. This is an optional module — a business that does not run attendance can switch it off entirely.

LAYER 1 Screens

- **Attendance events** — meetings and check-ins that staff mark against.
- **Per-event view** — mark and manage one event's attendance.
- **History** — the record over time.

LAYER 2 Actions

50. **Self-mark** — staff mark their own attendance for an event.
51. **Exempt** — mark a person exempt from an event they are not expected at.
52. **Filter** — by staff, event, brand, and date.

LAYER 3 States

- **Disabled** — attendance switched off for this business — the module is hidden.
- **Open** — event open, staff can still mark.
- **Auto-closed** — after the window closes, unmarked staff are auto-assigned late or absent.
- **Exempt** — an exempt person is skipped at close and skipped by the strike trigger.

LAYER 4 Rules

LOCKED RULE Attendance is an optional module — settable on or off per business.

LOCKED RULE Self-marking with an auto-close: after the window, unmarked staff are auto-assigned late or absent. The window length is settable.

LOCKED RULE Per-event exemptions: some staff legitimately are not expected at every event. An exempt person is skipped at auto-close and does not trigger a strike.

LOCKED RULE Role-scoped: admins view and edit all, managers mark and view their team, everyone marks their own.

9. Strikes

Status: **Locked** — exists in HR system · settable rules

A disciplinary record, not a deduction. Strikes are non-monetary; the threshold and its consequence are set by each business.

LAYER 1 Screens

- **Strikes list** — strikes issued, by staff member.
- **Issue strike** — record a strike against one or several staff.
- **Clear strike** — remove a strike.

LAYER 2 Actions

53. **Issue** — record a strike with a reason; can be issued to several staff at once.
54. **Clear** — remove a strike (admin).
55. **Filter** — by staff, brand, and date.

LAYER 3 States

- **Clean** — no strikes.
- **Issued** — strike recorded, staff notified.
- **Threshold hit** — the settable threshold is reached — the configured consequence triggers (e.g. HR review).

LAYER 4 Rules

LOCKED RULE Strikes are non-monetary — a disciplinary record, no fine matrix.

LOCKED RULE The threshold and its consequence are settable. The reference configuration is two strikes in a calendar month triggering an HR review; another business sets its own count and consequence.

LOCKED RULE Strikes can be issued individually or in bulk. Issuing notifies the staff member through the shared notification layer.

LOCKED RULE Role-scoped: admins issue and clear any, managers issue to their team, staff view their own.

10. Stars & Leaderboard

Status: **Locked** — exists in HR system · settable framework

Recognition and ranking, built as a configurable framework rather than one fixed scheme. The star system is the heart of it: a business sets how many star tiers exist, what earns each tier, and how stars feed the leaderboard and Star of the Month. One business runs a three-tier manual star system; another ranks purely by revenue with no stars at all.

LAYER 1 Screens

- **Award star** — award a star tier to a staff member.
- **Stars history** — stars awarded over time.
- **Leaderboard** — ranking, in the style the business chooses.
- **Star of the Month** — choose or confirm the month's winner.

LAYER 2 Actions

- 56. **Award star** — company heads award a star tier for meeting a settable criterion.
- 57. **Select SOTM** — run or confirm SOTM against the chosen criteria.
- 58. **Configure** — set number of tiers, what earns each, leaderboard style, and SOTM criteria and eligibility.

LAYER 3 States

- **Empty** — no stars or ranking configured yet.
- **Ranked** — staff ranked by the chosen style.
- **SOTM awarded** — winner chosen, prize flows to the Payroll SOTM component.

LAYER 4 Rules

LOCKED RULE Stars are TIERS a person holds (a one-, two-, or three-star performer), not a running tally. The number of tiers is settable — three, reducible to two, or the business's own count.

LOCKED RULE What earns each star tier is settable — a business defines the criteria worthy of a star, and heads award them manually.

LOCKED RULE The leaderboard ranks in the style the business chooses — by star tier, by revenue, by delivery rate, and so on.

LOCKED RULE Star of the Month is an optional feature, settable on or off, with settable criteria. The menu a business picks from: highest delivery, highest delivery rate, highest revenue, highest revenue per order, highest star tier, most upsells, or manual head's-choice.

LOCKED RULE SOTM eligibility is settable: minimum star tier to qualify, whether an active strike disqualifies, how many winners, and the prize amount. The prize flows to the Payroll SOTM component.

11. Leave

Status: **Locked** — exists in HR system · settable entitlements

Staff leave requests and balances across four leave types, with entitlements each business sets.

LAYER 1 Screens

- **Leave requests** — requests, pending and decided.
- **Request leave** — submit a leave request.
- **Decide** — approve or decline.
- **Balances** — days remaining per type.

LAYER 2 Actions

- 59. **Request** — choose type and dates, submit.

- 60. **Decide** — approve or decline a request.
- 61. **Filter** — by staff, type, brand, status.

LAYER 3 States

- **Pending** — request submitted, awaiting decision.
- **Approved** — approved, balance reduced, attendance not marked absent for those days.
- **Declined** — declined with a reason.

LAYER 4 Rules

LOCKED RULE Four leave types: annual, sick, emergency, unpaid. The default entitlement days for each are settable per business.

LOCKED RULE Annual leave balance auto-grants on first approval. An approved leave day is not marked absent by Attendance.

LOCKED RULE Role-scoped approvals: admins decide all, managers decide their team, staff request their own. Requesting and deciding fire notifications.

11b. Order Assignment

Status: **Locked** — **new for launch** · **settable**

How incoming orders are distributed across the CRS team. A business chooses the method that fits how it runs, and it is fully settable.

LAYER 1 Screens

- **Assignment settings** — the assignment method and the per-CRS inclusion, set business-wide.

LAYER 2 Actions

- 62. **Round-robin** — even rotation — each new order goes to the next CRS in turn.
- 63. **By percentage** — weight the split — for example 50/30/20 across three CRS, so stronger or full-time staff take more.
- 64. **Exclude a CRS** — take a CRS out of the rotation temporarily (on leave, newly onboarding, or underperforming) without removing them.

LAYER 3 States

- **Round-robin active** — orders rotate evenly across the included CRS.
- **Percentage active** — orders split by the set weights.
- **CRS excluded** — an excluded CRS receives no new orders until re-included.

LAYER 4 Rules

LOCKED RULE Order assignment is settable per business — round-robin or by-percentage — with the ability to exclude any CRS from the rotation temporarily without removing them from the team.

Delivery

The delivery group tracks stock leaving for the field, the external partners who carry it, and how well it converts to delivered orders. It ties directly to Inventory (stock held per agent) and Wallet (agents remitting the COD cash they collect). An important distinction runs through this group: an agent is not a staff member. Agents are external contractual delivery partners; staff are the internal team. They are separate entities, which is what keeps Payroll (internal team only) and Wallet (external agent remittance) cleanly divided.

12. Waybills

Status: **Locked — new for launch**

The stock-in ledger. A waybill records stock being sent from supplier or warehouse to an agent. It is where an agent's stock holdings originate, and it is the source Inventory reads from.

LAYER 1 Screens

- **Waybill ledger** — date, agent, product, quantity, cost, waybill fee, and status.
- **New waybill** — send stock to an agent.

LAYER 2 Actions

65. **New waybill** — record stock sent to an agent — the agent's inventory rises and the waybill fee flows to expenses.
66. **Filter** — by agent, product, status, month, and sub-brand.

LAYER 3 States

- **Empty** — no waybills yet.
- **Waybilled** — stock sent, sitting with the agent, not yet delivered — counts toward the balance.
- **Delivered** — the order against that stock has been delivered — leaves the balance.

LAYER 4 Rules

LOCKED RULE A waybill adds stock to the receiving agent. This is the stock-in event Inventory reads — agent holdings originate here (or from an agent-to-agent transfer).

LOCKED RULE Only the waybill FEE flows to expenses. The product cost is NOT booked as an expense at waybill time — it stays as inventory value and becomes cost-of-goods only when the order is delivered and sold. Booking product cost at waybill would double-count it.

LOCKED RULE Every waybill is dated and attributed, giving a full stock-in trail per agent.

13. Agents

Status: **Locked — new for launch**

Agents are the external partners who deliver. An agent is a contractual person or company that carries stock and delivers on the business's behalf — not a staff member and not on payroll. This is a deliberate separation from Staff.

LAYER 1 Screens

- **Agents list** — all agents, with location, current stock held, and delivery rate.
- **Agent record** — name, location, contact, stock held, delivery rate, and remittance history.
- **Add / edit agent** — add or edit an agent.

LAYER 2 Actions

67. **Add agent** — add a delivery partner — a person or a company.
68. **Edit agent** — edit details and contact.
69. **Filter** — by location and active status.

LAYER 3 States

- **Empty** — no agents yet.
- **Active** — agent holding stock and delivering, with a live delivery rate.
- **Holder only** — the warehouse — an agent that holds stock but does not deliver.

LAYER 4 Rules

LOCKED RULE An agent is external — a contractual person or company that delivers. It is NOT the same entity as a staff member, and agents are not paid through Payroll. They are paid via delivery fees kept from what they remit.

LOCKED RULE Agents hold stock (via waybills), deliver, collect COD, and remit through Wallet. Their stock holdings, delivery rate, and remittance history live on the record.

LOCKED RULE The warehouse is a special agent that holds but does not deliver.

LOCKED RULE Agents do not log into Numbatrak for now. They are purely records managed by the internal team, who enter their deliveries and mark their remittances. Agent-facing access may come later.

14. Delivery Analytics

Status: **Locked** — new for launch

A filterable view of how well stock converts to delivered orders. It merges two things: delivery performance (rate by agent, location, product) and the waybilled-versus-delivered-versus-balance roll-up that tracks stock value in motion.

LAYER 1 Screens

- **Analytics view** — headline metrics (waybilled value, delivered value, balance, delivery rate) plus the monthly roll-up table.

LAYER 2 Actions

70. **Filter** — recalculates every metric. Filters: agent, location, product, sub-brand, status, and time frame (today, weekly, monthly, custom).
71. **Break down** — see delivery rate by agent, by location, by product.

LAYER 3 States

- **Empty** — no delivery data yet.
- **Full** — full roll-up with the balance column per month.
- **Negative balance** — more delivered than waybilled that period — shown plainly, a normal state, not an error.

LAYER 4 Rules

LOCKED RULE Balance = waybilled value minus delivered value per period. It is stock value that left but has not yet converted to a delivery — money in motion, not a loss.

LOCKED RULE A negative balance is normal and valid. If operations began before using the system, agents deliver old stock that was never waybilled in, so deliveries can exceed waybills in a period. It is never flagged as a problem.

LOCKED RULE Delivery Analytics merges delivery performance (rate by agent, location, product) with the waybill roll-up (waybilled, delivered, balance).

LOCKED RULE Everything pulls from live data — waybills, orders, inventory. Fully filterable; every view recalculates on any filter, like the main dashboard.

Order Intake

These three features are the front end of how orders are created before they reach the Orders page. A customer fills a form; if they do not finish, it becomes an abandoned cart; and a CRS follows up to recover it. They share the same underlying mechanism as the Storefront checkout — both collect customer and order details — which is why abandoned-cart capture works for both. Several of these lean on the messaging layer (auto-WhatsApp), which is documented separately; the capability is named here and lights up fully once messaging is connected, but the features are not blocked waiting on it.

15. Order Forms

Status: **Locked** — new for launch

A builder for the customer-facing order form — the standalone, direct-response counterpart to the full Storefront checkout. It is a real form builder, not a fixed set of fields.

LAYER 1 Screens

- **Form builder** — configure fields, logic, and post-submit behaviour, per funnel.
- **Share / embed** — get the shareable link or embed code.

LAYER 2 Actions

72. **Build / edit form** — set fields, mark each required or optional, choose which funnel it feeds.
73. **Conditional logic** — show or hide fields based on answers — pick a product and its variant appears, pick a location and local options show.
74. **Multi-product** — offer more than one product or an add-on / order bump, which feeds the upsell.
75. **Validation** — phone-number format, required fields, and blocking junk or bot submissions.
76. **Redirect / confirmation** — on submit, show a thank-you message, redirect to a page, or redirect to a custom URL — with field values (name, phone) passable into the redirect, for example a WhatsApp link or a personalised thank-you / upsell page.

LAYER 3 States

- **Empty** — no form built yet.
- **Submitted** — a completed submission becomes a new order (status new) on the Orders page, tagged with its funnel.
- **Invalid** — required field missing or validation failed — the form shows what to fix, keeps what was entered.

LAYER 4 Rules

LOCKED RULE A completed form becomes a new order (status new) on the Orders page, tagged with the funnel it came from.

LOCKED RULE The form's package selector reveals offers that were created on the product — it does not define them. Offers are built once on the product (see Products); each form selects which of that product's offers to reveal. The same product's offers can appear on different forms, each revealing its own chosen subset.

LOCKED RULE Pricing is server-authoritative — the form cannot be edited by the customer to change the price. This carries over from the Storefront.

LOCKED RULE The form supports conditional logic, multi-product / order bump, validation, and a redirect or confirmation on submit (message, page, or custom URL with field values passed through).

LOCKED RULE Location on the form can drive the delivery fee, tying to the delivery configuration.

16. Abandoned Carts

Status: **Locked — new for launch**

A form or checkout a customer started but did not finish. These are recovery opportunities — often a phone number and a product is enough for a CRS to call and close the sale.

LAYER 1 Screens

- **Abandoned carts list** — carts started but not completed, with the partial details captured.

LAYER 2 Actions

77. **View cart** — open an abandoned cart and see what the customer entered before dropping off.
78. **Recover** — call the customer and complete the cart into an order.
79. **Filter** — by funnel, product, date, and status.

LAYER 3 States

- **Abandoned** — partial form saved with at least a contact detail.
- **Recovered** — cart completed into an order; leaves the abandoned list.

LAYER 4 Rules

LOCKED RULE A started-but-unfinished form is an abandoned cart, saved with whatever details were entered.

LOCKED RULE A cart with NO contact detail does not enter. With no phone or contact there is nothing to follow up on, so it is not captured as a cart.

LOCKED RULE On abandonment, an auto-WhatsApp recovery message fires via the messaging layer (once connected). Before messaging is connected, the cart still appears for the CRS to work by hand — the feature is not blocked.

LOCKED RULE Recovering a cart turns it into a normal order that flows through the whole pipeline.

17. Follow-Ups

Status: **Locked — new for launch**

The CRS task list for chasing recoverable orders, and a measure of how fast the CRS acts. After the auto-message goes out, a CRS personally follows up, converts the customer or not, and the tab tracks how quickly they moved.

LAYER 1 Screens

- **Follow-ups list** — carts and orders needing a human chase, with follow-up timing per CRS.

LAYER 2 Actions

80. **Follow up** — the CRS clicks follow up to personally chase an abandoned cart after the auto-message.
81. **Convert / not converted** — turn the follow-up into an order, or mark it not converted.
82. **Filter** — by CRS, funnel, product, date, status.

LAYER 3 States

- **Awaiting follow-up** — a cart is waiting for the CRS to act (timing is running).
- **Followed up** — the CRS has acted; the time-to-act is recorded.
- **Resolved** — converted into an order, or marked not converted.

LAYER 4 Rules

LOCKED RULE Follow-ups are worked by a CRS. After the auto-WhatsApp, the CRS clicks follow up, then converts the customer to an order or marks the opposite.

LOCKED RULE The tab measures the CRS's follow-up timing — how fast from the cart landing in their list to the CRS acting. It is surfaced as a CRS performance signal so a manager can see who is quick and who is slow to chase recoverable money.

LOCKED RULE Role-scoped and filterable: a CRS works their own follow-ups, a manager sees the team's; every list recalculates on filter.

Confirmed decisions

CONFIRMED DECISION Automated follow-up messaging (the auto-WhatsApp on abandonment) runs through the shared messaging layer, discussed when that layer is walked. The capability is named now so the full picture is visible, but the intake features are not blocked waiting on it — before messaging is connected, carts go straight to the CRS follow-up list without the auto-message.

CONFIRMED DECISION Order Forms and the Storefront checkout are distinct features but function effectively the same way, because even a prepaid store customer fills an information form (name, phone, delivery address). They share the collect-customer-and-order-details mechanism, so abandoned-cart capture works for both.

Products and Finance

The product catalog and the money features that read from it. The governing principle of this group, as everywhere else in Numbatrak, is that each business toggles on what works for them — the capabilities and offer types below are a menu configured per product, not a fixed structure imposed on everyone.

18. Products

Status: **Locked** — new for launch

The catalog everything references. A product is the definition of a thing; Inventory tracks where its units are. Products lives under the Storefront tab in the navigation, but the product data is universal — the order forms, the storefront, Inventory, Orders, Performance, and the media buyer's ad tracking all read from it. It is the shared spine of the whole app.

The product model

- **Product (parent)** — name, category, and a base cost price. Category groups the catalog and drives filtering.
- **Variants** — size, colour, or similar. Each variant carries its OWN cost price, sales price, and inventory line, and rolls up to the parent for combined performance. This handles both same-cost variants (a belt in L/XL/XXL) and different-cost variants (Medium Mat at cost 9,000 vs Very Long Mat at 18,000).
- **Offers** — named, priced packages of the product — the sellable unit on a form. A product can have MANY offers running at once, because this is marketing: a business tests different offers and angles on the same product.

The offer types

An offer is a defined basket at a set price. The types a business can create:

- **Quantity tier** — same product, different quantities, each at its own set price (buy 2 for 3,000 is deliberately cheaper than two singles).
- **Cross-product bundle** — the basket holds different products (belt + guide + bands). On delivery each product deducts from its own inventory and adds its own cost.
- **Single price** — one unit, one price — the simplest offer. On a storefront a discount (sale price) can apply here instead.
- **Buy X get Y free** — the customer pays for some units and receives more. The board must record the TRUE unit count including the free ones.

LAYER 1 Screens

- **Products list** — the catalog, filterable by category, sub-brand, with per-product performance and margin.
- **Product record** — name, category, cost, variants, and the list of offers.
- **Product builder** — create or edit a product, toggle capabilities, and add offers.

LAYER 2 Actions

83. **Create product** — set name, category, cost price.

84. **Toggle capabilities** — variants, bundle offers, discounts — each toggled on per product, in any combination, working on both the COD form and the storefront.
85. **Add offers** — build any of the four offer types on the product; add as many as the marketing needs.
86. **Add variants** — each with its own cost, price, and stock line.
87. **Filter** — by category, sub-brand, and time frame.

LAYER 3 States

- **Empty** — no products yet.
- **Full** — catalog with cost, price, margin, and stock (read from Inventory).
- **Performance** — units sold, revenue, and margin per product, viewable per variant or rolled up to the parent.

LAYER 4 Rules

LOCKED RULE Each business toggles on the capabilities and offer types that work for them. Nothing here is forced — a simple single-price product and a multi-offer bundled product are both valid configurations of the same builder.

LOCKED RULE A product is the definition (name, category, cost, variants, offers). Inventory tracks where the units are. Products shows total holdings but does not hold a separate stock number — there is one stock truth, in Inventory.

LOCKED RULE Every variant carries its own cost price, sales price, and inventory line, and rolls up to a parent product for reporting. Performance can be viewed per variant or for the whole parent family.

LOCKED RULE A product can have many offers at once. Offers are created on the product; the order form and storefront select which offers to reveal — they do not redefine them.

LOCKED RULE The accord rule: the true unit count in an offer must reconcile across order, inventory, cost of goods, and performance. A buy-1-get-1 offer moves 2 units on the board even though the customer pays one price — the free unit is a real cost.

LOCKED RULE Products lives under the Storefront tab, but the data is universal — read across the whole app, including the media buyer's ad tracking (which references products and offers so ad spend ties to the right offer). The media buyer references and selects products; creating them is an admin task.

Tiny parts

TINY PART Variant and offer are independent axes. On a form a customer can pick an offer AND a variant separately (the postpartum belt: choose the pack, then choose the size). They must not be modelled as the same thing.

TINY PART The buy-X-get-Y offer is where the accord rule earns its keep. The free units are real units — they deduct from inventory and count in cost of goods. If the board recorded only the paid units, margin would be overstated on every bundle.

19. Expenses

Status: **Locked** — new for launch · the money-out hub

Expenses is where all money-out converges. It is a hub, not a standalone list: some expenses flow in automatically from other features carrying their attribution, and the rest are entered directly. The critical discipline is avoiding double-counting — costs already deducted inside a per-order profit calculation never reappear here.

The feeders — what flows into Expenses

Four sources can flow in automatically, though every one of them can also be entered by hand — some businesses prefer recording everything manually, and that is fully supported. Automatic is an option, not a requirement.

- **Ad spend** — from Media Buyers, into Advertising, carrying brand, product, offer, and platform.
- **Contractor pay** — from Media Buyers payments (editors, VO artists), into Marketing, tagged to the brand and product.
- **Waybill fees** — from Waybills, into Operational — the cost of moving stock.
- **Failed-delivery and agent-covered costs** — from Wallet, into Operational — costs with no order to absorb them.
- **Direct entry** — rent, salaries, fuel, data, welfare, and everything else — recorded by hand, picking the category.

LAYER 1 Screens

- **Expenses list** — money out in four categories, filterable, with the ROAS-vs-ROI split.
- **Expense report** — the visual read of spending by category and over time.
- **Record expense** — direct entry by category and sub-category.

LAYER 2 Actions

88. **Record expense** — amount, category, sub-category, brand, note — and product/offer per the attribution rule below.
89. **Edit an auto-fed expense** — the attribution from Media Buyers or Wallet is inherited but editable.
90. **Add a sub-category** — under any of the four parents, custom to the business.
91. **Filter** — by category, sub-category, brand, product, offer, platform, and time frame.

LAYER 3 States

- **Empty** — no expenses yet.
- **Auto-fed** — ad spend, contractor pay, waybill fees, and failed-delivery costs appear with attribution.
- **Direct-entered** — a manual expense with its picked category and sub-category.
- **Reported** — the visual breakdown by category over time.

LAYER 4 Rules

LOCKED RULE Expenses is the money-out hub. Some expenses flow in automatically (ad spend, contractor pay, waybill fees, failed-delivery and agent-covered costs); the rest are entered directly. Every automatic feed can also be entered manually — automatic is an option, not a requirement.

LOCKED RULE Four fixed parent categories — operational, advertising, marketing, building — each with custom-editable sub-categories the business defines.

LOCKED RULE No double-counting. Anything already deducted in a per-order profit calculation never appears as an expense line. Cost of goods and the delivery fee on a successful order are per-order deductions (in the order's profit), not expenses. Only costs with no order to absorb them become expenses.

LOCKED RULE Advertising is isolated so ROAS (return on ad spend only) never merges with Business ROI (return after all four categories) — the same rule as the Dashboard.

LOCKED RULE Product/offer attribution requirement varies by category: for Advertising it is mandatory (ad spend without knowing its product and offer is useless for CPA and ROAS); for Marketing it should be present (creative was made for a specific product); for Operational and Building it is optional (rent and salaries are general overhead that cannot be split across products meaningfully).

LOCKED RULE Auto-fed expenses carry their attribution — brand, product, offer, platform inherited from the source — and it is always editable.

LOCKED RULE The expense report gives a visual read of spending by category and over time, filterable by every attribution key and time frame.

Tiny parts

TINY PART The hub principle is what keeps one clean profit truth. Because ad spend, contractor pay, and failed-delivery costs all converge here with their attribution, the Dashboard, Accounting, and Performance all read the same categorised money-out — there is no second, conflicting expense number anywhere.

TINY PART Attribution varies by category deliberately. Forcing rent to attribute to a single product would produce meaningless numbers; not forcing ad spend to attribute would break CPA and ROAS. The requirement is strict exactly where it matters (Advertising) and relaxed where it does not (Operational).

20. Invoicing

Status: **Locked — new for launch**

Generate, send, and record invoices. Invoicing is deliberately not automatic on every order — it is generated on request, with a shortcut from an order, and the customer receives their invoice automatically once their order is delivered.

LAYER 1 Screens

- **Invoice view** — generate an invoice, download or send it.
- **Invoice list** — invoices raised, filterable.

LAYER 2 Actions

92. **Generate manually** — create an invoice manually when requested.
93. **Generate from order** — a shortcut to generate an invoice straight from an order on the Orders page.
94. **Download / send** — download as PDF, or send to the customer (via the messaging layer).

LAYER 3 States

- **Generated** — invoice created, ready to download or send.
- **Auto-sent on delivery** — on successful delivery, the customer automatically receives their invoice.

LAYER 4 Rules

LOCKED RULE Invoices are generated manually — on request, or from an order via a shortcut. They are not auto-created on every order.

LOCKED RULE On successful completion of an order (once delivered), the customer automatically receives their invoice, via the messaging layer.

LOCKED RULE Because invoicing is manual and tied to an existing order, it does not re-record the order as a separate sale — the order already counts once delivered. This avoids double-counting revenue.

21. Media Buyers

Status: **Locked** — **new for launch** · **central to ad-running businesses**

Media Buyers is the entire advertising subsystem — where creative is produced, contractors are paid, ad spend is logged, and performance is measured. It is one of the most important parts of the product because it is the source of the ad-spend number that drives CPA and ROAS everywhere else. It has two connected sides: the creative production side (making and paying for ads) and the performance side (running and measuring them). This section is central to ad-running businesses; a business that does not run ads simply will not populate it.

The attribution spine

Everything in Media Buyers keys off one attribution hierarchy, from coarse to fine: Brand, then Product, then Offer, then Platform. This is the finest grain the business advertises to — it lets ad spend and revenue be tracked at any level: all of a brand, one product across all offers, one offer versus another (the 32K offer versus the 62K offer), or one platform versus another. Orders already carry their offer tag, so revenue and spend share the same key and ROAS works at every level. 'Offer' is the single attribution unit — the same offer object defined on the product; funnel and offer are treated as one thing, and angle-level nuance is carried by the ad creative instead.

Side one — creative production

PRODUCTION LOG

- **What it holds** — one row per batch of creatives being made: buyer, brand, product, creative type (Voiceover, UGC, AI Story, Sound), assigned VO artist and editor, video count, and status.
- **Mark Done** — marking a batch Done flows its videos into the ad catalog and updates the contractor's piece count for payment.

TEAM AND PAYMENTS

- **Team** — the contractors — VO artists and video editors — each with pieces done, paid, unpaid, their rate, and amount owed.
- **Contractor payments** — piece counts come from Done batches. Marking a contractor paid posts the payment to Expenses under Marketing, tagged to the brand.

AD CATALOG — CREATIVES AS REAL OBJECTS, NOT NAMES

An ad in the catalog is a real object, not a text label. This is the key design point: it carries (1) the creative — a link to the video in the business's Google Drive (a per-video link when the business has one, or the shared batch/folder link when they only have that); (2) its identity — hook type, creative type, and the product and offer it promotes; (3) its lineage — which production batch made it and who edited it; (4) its performance — but this is buyer-entered, not automatic (see the honest note below). One ad object equals one video creative; a batch of seven videos produces seven ad objects.

Side two — performance

SPEND ENTRY

- **Day grid** — the lightweight core: log spend and orders per day, and CPA auto-calculates. Every entry carries the Brand, Product, Offer, Platform key.

PERFORMANCE ANALYTICS

- **The drill-down** — the per-brand, per-product, per-offer, per-platform drill-down of the same CPA and ROAS numbers shown on the main Dashboard. This is where the 32K offer's CPA is seen against the 62K offer's, or Meta against TikTok. Fully filterable.

CPA TARGETS AND BUDGETS

- **Targets** — per-buyer CPA targets and weekly budgets, keyed by buyer, brand, product, and offer. This is what the Dashboard's colour tonation and alerts measure against. Each buyer sets their own; admins can too.

WEEKLY REVIEW — OPTIONAL

- **The review** — the media buyer's own report from their ads manager — their read on which ads won and lost, CPA per creative, biggest win and issue, an on-track/needs-attention/critical verdict, and next-week decisions (ads to scale, pause, kill). This is the buyer's reported view (human judgment pulled from Meta or TikTok), distinct from the system's own measured attribution which lives in the CRM. Toggleable per business — an agency managing buyers turns it on; a solo seller leaves it off and just logs spend.

LAYER 1 Screens

- **Production log** — batches of creatives being made, with status and assignment.
- **Team** — the VO artists and video editors.
- **Payments** — piece-rate contractor pay, flowing to Marketing expenses.
- **Ad catalog** — every creative as a real object with a Google Drive link, lineage, and accumulated performance.
- **Spend entry** — the lightweight day-grid for spend and orders.
- **Performance analytics** — the per-brand/product/offer/platform drill-down of CPA and ROAS.
- **CPA targets & budgets** — per-buyer targets by brand, product, offer.
- **Weekly review** — the optional narrative accountability layer.

LAYER 2 Actions

95. **New production entry** — creative type, buyer, brand, product, description, scripts, and assignment (VO, editor, dates).
96. **Mark batch Done** — flows videos into the catalog and updates piece counts.
97. **Mark contractor paid** — settles owed pieces and posts to Marketing expenses.
98. **Open an ad** — see the creative (Drive link), its lineage, and its performance history.
99. **Log spend** — per day, per Brand, Product, Offer, Platform. CPA auto-calculates.
100. **Set a target** — CPA target and weekly budget per buyer, brand, product, offer.
101. **Toggle weekly review** — on for accountability, off to keep it simple.
102. **Filter** — by brand, product, offer, platform, buyer, and time frame.

LAYER 3 States

- **Empty** — no production, catalog, or spend yet — a business simply has not run ads.
- **In progress** — a batch briefed, shooting, or editing.
- **Done** — creatives in the catalog, contractor pieces countable.
- **Calculated** — CPA and ROAS computed live from spend and delivered orders.
- **Over target** — a CPA above its per-buyer target flags on the Dashboard.

- **Review off** — the narrative layer hidden for businesses that do not use it.

LAYER 4 Rules

LOCKED RULE Everything keys off the attribution spine: Brand, Product, Offer, Platform. This is the finest grain the business advertises to, and it lets spend and revenue slice to any level.

LOCKED RULE Marking a production batch Done flows its videos into the ad catalog and updates contractor piece counts.

LOCKED RULE Contractor pay is piece-rate — counts come from Done batches. Marking paid posts to Expenses under Marketing, tagged to the brand.

LOCKED RULE An ad is a creative object, not a name. One ad object equals one video. The Google Drive link is added per batch: at Mark Done, one folder link is pasted for the whole batch, and every ad object created from that batch shares it (told apart by name or number). The link can also be added later rather than at Done. Each ad carries its identity (hook, type, product, offer) and its production lineage. Performance attribution follows the two-path model below, not manual ad-ID mapping.

LOCKED RULE Ad spend is entered once, with the Brand, Product, Offer, Platform key, and read by both Expenses (Advertising) and Performance (CPA and ROAS) — never recorded twice. It is always editable.

LOCKED RULE ROAS equals delivered revenue divided by ad spend; Real CPA equals ad spend divided by delivered orders. Both key off the same attribution, so they slice to any level. This is the same revenue truth used everywhere — delivered orders.

LOCKED RULE Performance analytics is the drill-down of the Dashboard's CPA and ROAS — the same numbers, broken out per brand, product, offer, platform, and buyer.

LOCKED RULE CPA targets drive the Dashboard flags — a CPA above its per-buyer target is what colour tonation and alerts measure against.

LOCKED RULE The weekly narrative review is optional and toggleable per business. The spend entry it used to sit inside is core and stays.

Confirmed decisions

CONFIRMED DECISION The weekly report was split: the hard performance data (spend and orders per day) is core and lightweight because the system computes CPA and ROAS from it; the soft narrative (wins, losses, verdict, next-week plan) is an optional accountability layer, because a solo seller does not need it while an agency managing buyers does.

CONFIRMED DECISION Ad creatives are referenced by Google Drive link, not uploaded and hosted inside Numbatrak. Editors already deliver to Drive; the catalog holds the link. Hosting video would add storage cost and upload friction for no launch benefit.

CONFIRMED DECISION Legacy-week import (from the old spreadsheet tracker) is dropped. A public SaaS starts fresh per business; there is no legacy to carry.

CONFIRMED DECISION Expense Claims, considered earlier, is not part of the product and has been removed. It was not in the existing system.

Tiny parts

TINY PART Ad spend flows to Expenses carrying its full attribution (brand, product, offer, platform, and the Advertising category), so an expense line is never just an untagged lump. The attribution is inherited from the media-buyer entry but remains editable.

TINY PART The distinction between an ad as a name and an ad as an object is what makes the catalog valuable. A name is a disposable label; an object accumulates a track record. Picking the object in the weekly review is what lets performance build up per creative rather than being lost each week.

TINY PART Two independent attribution reads, neither requiring the buyer to map ad-IDs. Path one is the weekly review — the buyer's reported view from their ads manager (human judgment). Path two is server-side attribution — the system's own measured capture: when a customer orders, the server records where they came from (the click-ID, UTM, and source data carried into the order). This measured view lives in the CRM, where customers can be filtered by delivered-versus-not and by source. The two coexist: one is what the buyer reports, the other is what the system measures directly. The catalog link between a platform ad and a specific creative is deliberately NOT built by manual ad-ID mapping (too much work for the buyer); creative-level certainty beyond the buyer's report is future work.

TINY PART How this attribution differs from dedicated platforms (Triple Whale, Northbeam, Hyros): Numbatrak does last-click, first-party, single-touch attribution anchored to delivered orders — it records the entry point of every real order. Those platforms do multi-touch journey modeling, cross-platform deduplication, and view-through attribution, which are heavier and statistical. For a COD business anchored on delivered orders, last-click first-party is arguably more trustworthy than platform-reported conversions (which are inflated and deduplicated by guesswork). Multi-touch modeling is future work — either an integration with one of those platforms or a Numbatrak engine built later.

22. Customer Management (CRM)

Status: **Locked** — **new for launch** · **a full subsystem**

The CRM is where every customer lives, how they are called for feedback, how complaints are handled, and how the business markets back to them. It is five connected parts inside one tab: the Customer Database, Feedback Calls, Complaints, and Automations (marketing campaigns), with the More Purchase mechanic woven through. It is financially entangled with Orders, Inventory, Wallet, and Expenses — those connections are the point, because they keep the one revenue truth honest.

Part one — Customer Database

One record per person, deduped on phone (COD identity). Every customer who ever placed an order is here — delivered or not — so failed and refunded orders stay visible as re-marketing signal.

- **Details** — name, email, WhatsApp/phone, location — the contact details that the Automations and messaging run on.
- **Lifetime value** — total across all their orders and more purchases, combined.
- **Income sources** — order revenue and more-purchase revenue shown side by side, then combined — so income sources are easy to read (mirroring the business's own combined report).
- **Products they buy** — the products this customer buys, filterable across the database.
- **Source** — first-click (how they were acquired) and last-click (what converted this order) both on the record, from the storefront attribution.
- **History** — every order and more purchase with its status (delivered, failed, refunded).

Part two — Feedback Calls

Two faces: an operational queue and an analytics dashboard.

THE OPERATIONAL QUEUE

- **Auto-scheduled** — a delivered order auto-schedules a feedback call a settable window after delivery (default around 3 days). Today's calls shows what is due per officer.
- **Disposition** — each call is classed — answered, no-answer, wrong-number, switched-off, unreachable, or callback-requested. Callbacks and history are their own views.
- **Captured on the call** — on an answered call: satisfaction score, reorder likelihood, an optional More Purchase, or a transfer to Complaints.

THE ANALYTICS DASHBOARD

- **Reach** — total calls, attempted, answer rate, average attempts to reach.
- **Satisfaction** — average score, happy rate (4-5 stars), unhappy rate (1-2 stars), scoring coverage, a distribution histogram, and an 8-week trend.
- **More Purchase revenue** — revenue, COGS, delivery, profit, and profit-per-call from More Purchases made on calls — the metric that tells you if the calling operation earns its labour.
- **Customer signals** — reorder likelihood (definitely/maybe/no/unlikely), red-flag rate, and products with red flags — which products generate the most complaints.
- **Per officer** — calls, answer %, avg satisfaction, attempt %, convert %, transfers, red flags — side by side per officer.

Part three — Complaints

A list of individual issues AND a dashboard of the patterns, so complaints become a measured cost centre rather than a support annoyance.

- **The list** — logged against the customer and their order, with photo/receipt attachments and an escalation path (escalating notifies the founder).
- **The dashboard** — total, open/resolved/escalated, resolution rate, complaints by product, by type (wrong size, damaged, never received), by agent/location, refund-vs-replacement counts, and the total Chargebacks cost over the period.

Part four — Automations (marketing campaigns)

Where the business markets back to its own database. Built and sent from inside the CRM, using the customer contacts and segments; the Messaging and Integrations layer is only the underlying pipe.

- **Campaign builder** — segment the database — lapsed customers, failed deliveries, repeat buyers, by source, by product — and send an email or WhatsApp campaign.
- **Credits** — two separate pools, email and WhatsApp, shown right here where campaigns spend them. Only marketing campaigns consume credits; transactional messages (order confirmation, abandoned-cart, feedback scheduling, invoice send) are included in the subscription and do not.
- **Buying credits** — credits are bought by the business from the platform. The platform operator prices them in Super Admin — credit sales are a platform revenue stream. Top-up surfaces right in Automations where they are spent.

The More Purchase mechanic

A More Purchase is an existing customer buying more, captured on a feedback call. It is NOT an order and does not merge into the customer's original order — but it is economically a full sale.

WHAT IT DOES

- **Full sale economics** — deducts from inventory, books COGS and delivery, computes its own profit — the same economics as any sale.
- **Fulfilment** — fulfilled like any delivery: an agent delivers it, deducts their stock, collects the COD, and remits via Wallet.
- **Where it lands** — attaches to the customer record, lifts LTV, and shows as a separate income line beside order revenue in the combined report — it never becomes an Order.

LAYER 1 Screens

- **Customer Database** — one record per person with details, LTV, income sources, products, source, history.
- **Feedback queue** — today's calls, callbacks due, history — the operational queue.
- **Feedback dashboard** — reach, satisfaction, more-purchase revenue, signals, red flags, per-officer.
- **Complaints** — the issues list and the patterns dashboard.
- **Automations** — the campaign builder with segments and the two credit balances.

LAYER 2 Actions

103. **Open a customer** — LTV, income breakdown, products, first/last source, full history.
104. **Work the queue** — disposition a call, log satisfaction, record a More Purchase, set a callback, or transfer to Complaints.
105. **Handle a complaint** — attach photos, escalate to founder, resolve by refund or replacement.

- 106. **Build a campaign** — segment the database, choose email or WhatsApp, send — consuming the matching credit pool.
- 107. **Buy credits** — top up email or WhatsApp credits, right where they are spent.
- 108. **Filter / segment** — the whole database and both dashboards by status, source, product, location, value, officer, brand, time frame.

LAYER 3 States

- **Auto-populated** — any order (delivered or not) creates or updates the customer record.
- **Repeat / more-purchase** — orders and more purchases aggregate; LTV grows.
- **Call due / dispositioned** — call due a settable window post-delivery, then classed by outcome.
- **Complaint states** — complaint open, escalated, or resolved; order refunded or replacement sent.
- **Credit balance** — credits sufficient, low, or depleted — campaigns blocked when a pool is empty until topped up.

LAYER 4 Rules

LOCKED RULE Every customer who placed an order is in the database — delivered or not — one record per person, deduped on phone, holding contact details, LTV, products, source, and history.

LOCKED RULE A More Purchase is economically a full sale: it deducts inventory, books COGS and delivery, and is fulfilled like any delivery (agent delivers, deducts stock, collects COD, remits via Wallet). But it attaches to the customer, not the Orders pipeline, and shows as a separate income line lifting LTV.

LOCKED RULE First-click and last-click source both live on the customer record, from the storefront attribution (this is the server-side, measured view — distinct from a media buyer's reported weekly review).

LOCKED RULE A feedback call auto-schedules a settable window after delivery. The queue is today's calls, callbacks, and history, each dispositioned and assigned to an officer.

LOCKED RULE A refund reverses the sale — the order flips to Refunded and its revenue and profit come off the books. It does NOT book a fresh full-amount expense (that would double-count). Refunded opens a Chargebacks expense for the real loss: the sunk delivery fee always, plus the product cost only if the item is not returned.

LOCKED RULE A replacement books a loss — one unit out of inventory plus its cost plus the redelivery fee, with no new revenue. Both refund and replacement losses land in a Chargebacks sub-category under Operational, so all such losses are traceable in one place.

LOCKED RULE Marketing campaigns consume credits from two separate pools (email, WhatsApp). Transactional messages are included in the subscription and do not consume credits. Credits are bought from the platform and priced in Super Admin — a platform revenue stream. A campaign is blocked if its pool is empty.

LOCKED RULE Complaints has both a list (individual issues) and a dashboard (patterns and total Chargebacks cost), turning after-sales into a measured cost centre.

Tiny parts

TINY PART The customer contact details (email and WhatsApp) are the join between the CRM and the Messaging layer. The CRM holds the audience and triggers the sends; the Messaging and Integrations layer is only the pipe that delivers. A business experiences campaigns entirely inside the CRM's Automations, never in a separate messaging area.

TINY PART The refund arithmetic is the trap. Reversing the sale AND booking the full refund amount as an expense would double the loss. The sale reversal handles the revenue; the Chargebacks expense captures only what is genuinely unrecoverable — the delivery fee, and the product if it does not come back.

TINY PART More Purchase versus order-time upsell: an upsell added to an order at order-time is part of that order. A More Purchase from a feedback call is a customer-level sale that lifts LTV and shows as its own income line. They are different things and must not be conflated.

Messaging and Integrations

Status: **Locked** — **new for launch** · **a cross-cutting layer**

This is not a feature a business visits to do work — it is plumbing that every other feature borrows. It has two jobs: Integrations (the API keys a business plugs in once) and Messaging (the single sending engine that uses them). Order confirmations, cart recovery, invoices, notification emails, and CRM campaigns all send through this one layer, so the business configures it once and everything sends the same reliable way.

Integrations — the key store

A business plugs in its own credentials for each service, once, in Settings. Every feature that needs to send or track then uses them without asking again. Keys are stored securely and never shown in full after saving.

- **Email provider** — transactional and campaign email.
- **WhatsApp Business API** — confirmations, recovery, and campaigns over WhatsApp.
- **SMS gateway** — an optional fallback channel.
- **Paystack** — storefront payments and — importantly — the credit top-up purchase, where the business buys email/WhatsApp credits from the platform.
- **Ad pixels** — Meta and TikTok pixels plus CAPI, for the storefront attribution.

The sending engine

One engine sits behind every message in the whole app. Features do not each talk to WhatsApp or email directly — they hand the message to this engine, which picks the channel, checks credits only if it is a campaign, sends via the connected provider, and logs the result.

109. **Trigger** — a feature triggers a send (order delivered, cart abandoned, campaign launched, invoice raised).
110. **Channel** — the engine picks email, WhatsApp, or SMS fallback, using the connected integration's keys.
111. **Credit check** — a marketing campaign draws down the matching credit pool; transactional messages skip this (subscription).
112. **Send and log** — the message goes out through the provider; delivery status is logged and visible.

Every automated message — editable and toggleable

Every automated message is its own editable template, per channel (the email and the WhatsApp versions are separate, both editable), built around merge fields the system fills per send (customer name, product, order number, amount, delivery date, tracking). And every trigger is independently toggleable per business — on or off, and on which channel. A business might want a WhatsApp on dispatch but no email, or skip the dispatch message entirely. The full transactional set, each its own template:

- **New order placed** — confirmation the order was received.
- **Order confirmed** — when the status moves to confirmed.
- **Order dispatched / out for delivery** — a heads-up that it is on the way.
- **Successful delivery** — a thank-you on delivery.
- **Abandoned-cart recovery** — the nudge to finish an unfinished form.
- **Invoice send** — the invoice delivered to the customer.
- **Refund confirmation** — when a refund is processed.

- **Replacement dispatched** — when a replacement is sent.
- **Internal notification emails** — payroll marked paid, strikes, complaint escalations and the rest — these originate in the Notifications layer but send through this engine.

Marketing campaigns are the exception: they are composed per-campaign in the CRM's Automations (each blast is different), not fixed templates. Everything above is a template.

LAYER 1 Screens

- **Integrations** — the key store in Settings: email, WhatsApp, SMS, payments, pixels.
- **Message templates** — every automated message, each editable per channel, each toggleable.
- **Message log** — what was sent, to whom, on which channel, and its delivery status.

LAYER 2 Actions

113. **Connect a service** — paste the API key or token, test, save.
114. **Edit a template** — edit the wording per channel, around the merge fields.
115. **Toggle a trigger** — turn any message on or off, per channel.
116. **View the message log** — delivery status, failures, filterable.

LAYER 3 States

- **Not connected** — a channel has no key; features that need it fall back or queue for a human.
- **Connected** — the channel is live; automated sends flow.
- **Sent / failed** — each message logged with its provider result.

LAYER 4 Rules

LOCKED RULE Integration keys are entered once in Settings and reused by every feature that sends or tracks — no feature stores its own keys.

LOCKED RULE One sending engine sits behind every message. Features hand it the message; it picks the channel, checks credits if a campaign, sends, and logs.

LOCKED RULE Every automated message is an editable template, per channel, built around merge fields; and every trigger is independently toggleable per business — on or off, and on which channel.

LOCKED RULE Transactional messages are subscription-included; only CRM marketing campaigns consume the email and WhatsApp credit pools.

LOCKED RULE Features are not blocked before a channel is connected — they degrade gracefully (for example, abandoned-cart recovery goes straight to the CRS follow-up list if WhatsApp is not connected) and light up automatically once the key is in.

LOCKED RULE Paystack powers both storefront payments and the credit top-up, so the business buys credits from the platform through the same integration.

Tiny parts

TINY PART The reason this is a layer and not a feature: its whole value is that everything sends the same way and is set up once. If each feature managed its own keys and sending, a business would configure WhatsApp five times and templates would drift. Centralising it means one setup, one message log, one credit check.

Notifications

Status: **Locked** — new for launch · a cross-cutting layer

The twin of the Messaging layer: Notifications decides WHAT to tell people and WHO to tell; the Messaging engine sends the email part. Every feature emits events, and this layer routes each to the right people over the right channel. The bell is native to this layer; the email rides the Messaging engine already documented.

The bell

Each person's own in-app feed — their accumulated notifications, newest first, unread marked. Opening one marks it read for that person only and jumps to the thing it is about.

Audience resolution — the core mechanic

A notification must reach the right people, and 'right people' is role-and-scope-based. This is the hardest and most failure-prone part.

LOCKED RULE Audience resolves by role AND scope: a person's primary role plus any extra roles, and their primary brand plus any extra brands. A manager covering two brands must catch events for both. If the resolver checks only the primary role or primary brand, the notification silently reaches nobody — the exact failure mode to guard against.

LOCKED RULE An empty audience is a guarded failure. If an event resolves to nobody, it is logged for review, never silently dropped.

Fan-out and read state

LOCKED RULE One event fans out to N recipients, and each recipient has independent read/unread state. One person reading a notification does not mark it read for anyone else. A notification is therefore an event plus a per-recipient delivery, each tracked separately.

The channel split — bell versus email

The test for whether an event gets email (plus bell) or bell only: does it need to be provable or traceable later, or is it just awareness? Anything touching money, stock movement, discipline, or complaints needs an audit trail and gets email. Pure workflow awareness stays in the bell. Every email-tier event carries its audit trail (who, what, when).

EMAIL + BELL — NEEDS A TRAIL, MUST NOT BE MISSED

- **Money** — payroll marked paid, payslip ready, manual payroll adjustment.
- **Wallet** — remittance to review, shortfall standing.
- **Alerts** — every Dashboard red-flag alert.
- **Discipline** — strike issued, strike threshold or consequence reached.
- **Stock movement** — low stock, waybill received, damaged or missing stock, failed delivery.
- **Complaints** — complaint logged, complaint escalated, refund processed.
- **Media money** — contractor payment marked paid, CPA or budget exceeded.
- **Platform** — credits low or depleted, subscription or payment due, integration disconnected or key failing.

BELL ONLY — AWARENESS

- **Recognition** — star awarded, SOTM prize.
- **People workflow** — leave requested, leave decided, attendance auto-close or missed mark.
- **Order workflow** — new order placed, abandoned cart captured, follow-up due.
- **Media workflow** — production batch done, weekly report submitted or missing.
- **CRM workflow** — feedback call due today, callback due.

Settings control

The business owner or admin controls notifications for the whole business, in Settings.

LOCKED RULE Each event has two independent on/off switches — bell and email — set business-wide by the owner or admin. Nothing is locked on. The owner decides, for example, low-stock emails on, star-award bells on, a workflow bell off — and it applies across everyone in that event's audience. These are defaults per the settable principle; per-user control is future work.

LAYER 1 Screens

- **The bell feed** — each person's own accumulated notifications, newest first, unread marked.
- **Notification settings** — the per-event bell and email switches, owner-controlled, business-wide.

LAYER 2 Actions

117. **Open a notification** — marks it read for you, jumps to the thing it is about.
118. **Mark all read** — clears your unread count — yours only.
119. **Toggle an event** — the owner flips an event's bell or email switch for the whole business.

LAYER 3 States

- **Unread / read** — per recipient, independent — one person reading does not affect another.
- **Email queued / sent** — for email-tier events, the email is handed to the Messaging engine.
- **No recipients** — the guard case — an event resolving to nobody is logged, not silently dropped.

LAYER 4 Rules

LOCKED RULE The bell is native to this layer; the email rides the Messaging engine. Notifications decides what and to whom; Messaging sends.

LOCKED RULE Channel by the trail test: money, stock, discipline, and complaints get email plus bell and carry an audit trail; pure awareness stays bell only.

LOCKED RULE The owner or admin sets both switches per event, business-wide — nothing locked on.

23. Storefront

Status: **Locked** — ported from the live ÀYỌNÍ build (ayoni.ng)

The storefront is the retail face of Numbatrak — a multi-tenant e-commerce capability ported from the live ÀYỌNÍ build. Each business gets its own shop with its own theme, products, and trackable pages. It is not a separate system: storefront orders flow into the same Orders pipeline, read the same universal products, deduct the same inventory, and trigger the same messaging, notifications, CRM, and finance wiring as every other order. Everything is owner-configured through editable sections, never programmed.

Two surfaces the storefront provides

The storefront gives a business two distinct selling surfaces, drawn from the same product catalog. They are separate builders, not a per-product toggle — a business builds a store, and can additionally turn on funnel pages for products it wants to run ads to.

THE STORE — CLEAN SHOPIFY-STYLE SHOP

- **What it is** — homepage, collections, product pages, cart, wishlist, search, plus standard e-commerce pages (contact, about, footer links, policies).
- **Store product page** — a clean, standard product page — gallery, price, variants, add-to-cart, description, reviews — that flows to the proper storefront checkout. Discounts are optional here.

FUNNEL MODE — SETTABLE STANDALONE LANDING PAGE

- **What it is** — a standalone single-product page with the full persuasive layout (hero/problem headline, story, solution, how it works, who it's for, testimonials, packages, guarantee and trust, FAQ, order). Turned on per product by the owner.
- **Own trackable link** — its own link with pixel tracking, so a business sends ad traffic straight to it and measures it.
- **COD form on page** — COD-style, form on the page — the order form sits right on the funnel (no cart journey). This form IS the Order Form builder (feature 15), wrapped in the funnel page: it reveals the product's offers/packages and carries the offer's attribution.

The checkout — proper for the store, adaptive to the COD setting

The store checkout is the proper Shopify-style flow (cart, contact, delivery, discount, payment). It adapts to a store-level payment setting the owner controls.

- **Payment setting** — the owner sets COD only, Prepaid only, or Both. Both lets the buyer choose Pay on Delivery or Pay Now at checkout; the others show just that one.
- **Prepaid flow** — prepaid orders are paid at checkout via Pystack. Delivery still triggers the revenue (the one revenue truth holds), but the money is already in — so a prepaid order skips the Wallet remittance (no agent collected COD) and its delivery fee was charged at checkout.

Discounts — Shopify-style, owner-settable

The store checkout supports the four Shopify-style discount types, each created by the owner with clicks (automatic or code-based, with thresholds). These are distinct from product offers: an offer is the attributed commercial unit; a discount is a checkout-time reduction applied on top.

- **Amount off products** — percentage or amount off specific products or collections.
- **Buy X get Y** — buy one get one free, or at a discount.
- **Amount off order** — percentage or amount off the whole order total.

- **Free shipping** — free delivery, for example over a set order value (the business absorbs the delivery cost).

Discounts reduce the true booked revenue (a 30% discount books the reduced amount) or add an absorbed cost (free shipping), so finances stay honest. Discounts do not change attribution.

Delivery configuration

Per-method toggles and zone-based rates by location (the ÀYÒNÍ delivery-config logic), set once by the owner. At checkout the correct fee is quoted from the customer's location, and that fee flows straight into the order's finances (a per-order deduction on a successful delivery, never double-counted as an expense). A VAT toggle applies VAT at checkout.

Attribution and tracking

The measured, server-side source that we kept referencing across the CRM and Media Buyers lives here.

- **First and last click** — when a customer lands from an ad, the URL carries UTM tags and a click ID (fbclid/ttclid/gclid). The site captures these sticky-first on landing (first touch not overwritten) AND the last touch that carried into this order, persisting both with the order.
- **Pixels** — Meta, TikTok, GA4, Snap, and Pinterest browser pixels fire per-page events (ViewContent, AddToCart, Purchase).
- **Server-side CAPI** — a server-side CAPI Purchase event with hashed PII backs up the browser pixel, surviving ad-blockers.
- **Catalog feed** — a Google Merchant catalog feed at a public endpoint, unlocking dynamic product ads.

This measured source flows to the customer record in the CRM, where customers are filterable by delivered-versus-not and by source.

The setup — section-based, owner-edited

Both surfaces are built from editable sections. The owner edits each block's content — text, images, videos, the offer — per brand. It is a section editor, not a locked template. Creative assets (images and videos) can be drawn from the business's own media, including the winning creatives in the Media Buyers ad catalog. Nothing is programmed; the whole storefront is configured through clicks and edits.

Wiring into the rest of Numbatrak

The storefront is another intake surface that plugs into everything already built.

- **Orders** — store checkout and funnel form both write to the Orders pipeline, tagged with source and offer.
- **Messaging** — storefront orders trigger the transactional messages through the Messaging engine — new order placed (the confirmation), confirmed, dispatched, successful delivery, invoice, refund, replacement — each an editable template, per channel, toggleable. Plus a floating WhatsApp chat icon (bottom right) on every page with customizable messages, and the WhatsApp-confirm deep-link flow on order placement.
- **Abandoned cart** — a store cart or a funnel form started but not finished fires abandoned-cart recovery — but only if a contact detail was captured (per the Abandoned Carts rule).
- **CRM** — every storefront customer lands in the CRM database (delivered or not, with source), becoming a campaign audience.
- **Notifications & finance** — new-order and low-stock events route through the Notifications layer; delivery, refund, and replacement flow through the same Wallet and Chargebacks finance wiring as any order.

LAYER 1 Screens

- **Customer store** — homepage, collections, product pages, cart, wishlist, search, contact/about/policies.
- **Store product page** — clean Shopify-style — gallery, price, variants, add-to-cart, description, reviews.
- **Funnel page** — standalone persuasive single-product page with COD form on page and a trackable link.
- **Checkout** — the proper checkout — contact, delivery, discount, adaptive payment.
- **Store admin** — store dashboard, collections/products, orders (with source and attribution), delivery config, discounts, theme, domain, tracking settings.

LAYER 2 Actions

120. **Shop the store** — browse, add to cart, apply a discount, pick delivery, place an order.
121. **Run a funnel** — send ad traffic to a product's standalone funnel link, tracked by pixel.
122. **Build with sections** — edit each section's content — text, images, videos, offers — per brand.
123. **Configure the store** — set COD/Prepaid/Both, create discounts, configure delivery zones, set theme and domain, paste tracking credentials.

LAYER 3 States

- **Cart persisted** — survives across sessions without an account.
- **Order server-priced** — the server re-fetches real prices and revalidates stock before insert — never trusts the client.
- **Attributed** — first and last touch captured and persisted with the order, flowing to the CRM.
- **Funnel live** — a product's standalone funnel is turned on, with its own pixel-tracked link.

LAYER 4 Rules

LOCKED RULE The storefront provides two separate surfaces from one catalog: the store (clean Shopify-style, proper checkout, optional discounts) and funnel mode (settable standalone single-product page, own pixel-tracked link, COD form on page using the Order Form builder). They are separate builders, not a per-product toggle.

LOCKED RULE Pricing is server-authoritative — the server re-fetches real prices and revalidates stock; it never trusts the client's numbers.

LOCKED RULE The store checkout adapts to the owner's payment setting (COD / Prepaid / Both). Prepaid is paid at checkout via Paystack; delivery still triggers revenue, but the money is already in, so it skips the Wallet remittance.

LOCKED RULE The four Shopify-style discount types are owner-settable and distinct from product offers. Discounts reduce true booked revenue or add an absorbed cost, so finances stay honest, and do not change attribution.

LOCKED RULE Source is captured sticky-first on landing (UTM plus click IDs) AND last touch, both persisted with the order and flowing to the CRM customer record. Server-side CAPI backs the browser pixels.

LOCKED RULE Every surface writes orders to the same Orders pipeline, tagged with source and offer, and reads the same universal products and inventory. The storefront is an intake surface, not a silo.

LOCKED RULE Both surfaces are built from editable sections, owner-edited per brand, drawing creative from the business's own media including the ad catalog. Configured through clicks, never programmed.

LOCKED RULE The storefront wires into everything: transactional messages and the WhatsApp chat icon and confirm-flow (Messaging), abandoned-cart recovery on both surfaces (if contact captured), CRM audience, Notifications, and the same Wallet and Chargebacks finance wiring.

LOCKED RULE Multi-tenant — each business gets its own shop, its own theme, a custom domain or subdomain, and row-level tenant isolation.

Tiny parts

TINY PART The store product page and the funnel page are deliberately different. The store page is clean and short (Shopify-style) because a catalog shopper is browsing; the funnel page is long and persuasive (the full section stack) because ad traffic needs to be sold in one scroll. Same product, two presentations, chosen by traffic type.

TINY PART The funnel's form is not a new form system — it is the Order Form builder (feature 15) wrapped in the funnel page, so it already carries offers, order bumps, conditional fields, validation, redirect/confirmation, and attribution.

TINY PART Prepaid is the one place the money arrives before delivery. It does not break the one revenue truth (revenue still books on delivery), but it changes the cash path — direct via Paystack, skipping the agent-collection-and-Wallet-remittance route that COD takes.

24. Settings

Status: **Locked** — **new for launch** · **fully self-serve**

The account layer, separate from the product — where a business manages its subscription, team, billing, and details. It must be fully self-serve: no routine account action should require contacting support. Note that several settings live in their own features and are reached from there: store settings in the Storefront, notification switches in the Notifications layer, integration keys and message templates in the Messaging & Integrations layer, and order assignment in Staff Management.

Profile

- **Identity** — name, email, password, business name and logo, phone and WhatsApp for notifications.
- **Timezone** — settable — drives the correct date and time on every record.
- **Currency** — Naira by default, settable.
- **Delete account** — offers a data export first, then a confirmation, then deletes — and shows the exit survey (see below).

Subscription — the state logic

The subscription is not just a plan label; each state and transition has deliberate rules.

- **Upgrade** — pay now, access unlocks immediately, prorated.
- **Downgrade** — takes effect at the renewal date, not immediately — the business keeps what it paid for until then, and while pending it may only perform actions its new lower tier allows.
- **Cancel** — an exit survey captures the reason (critical product data that flows to the Super Admin churn analytics), then access continues to the end of the cycle.
- **Reactivate** — one-click resubscribe within the 90-day retention window, because the data is still intact.

SUBSCRIPTION STATES

- **Inactive** — can perform only actions related to their subscription (renew, update payment, reactivate) — other subscription-gated actions are blocked, but the account and data remain.
- **Downgraded** — permitted only the actions the new lower tier allows.

Failed payment — the dunning timeline

A precise sequence, not a single cut-off:

124. **3 days before expiry** — alert the business that payment is about to fail or expire.
125. **At expiry** — a 24-hour grace period after expiry where everything still works.
126. **After grace** — the account is locked from actions, but all data remains intact (nothing deleted).
127. **While locked** — at least one email warning every week while locked out.
128. **90 days** — only after 90 days inactive is data deleted.

Team members

- **Manage** — name, email, role, permissions; removal revokes access immediately; per-member activity log.
- **Slots gate by plan** — the number of team slots is set by plan tier.

LOCKED RULE On downgrade, if the business exceeds what the new tier allows — too many team members, OR features it is actively using that the lower tier does not include — the system warns ahead (naming exactly what will be lost) and holds the downgrade as pending until the business resolves it themselves. Access is never silently stripped.

Billing

- **History** — every past payment — date, amount, plan, method, status.
- **Download** — any single invoice as PDF, or a date range as a ZIP for accounting.
- **Payment method** — replace an expired or declined card.

Data management

- **Export** — full account data as CSV, on every plan — no lock-in.
- **Import** — CSV upload for bulk orders, products, and expenses.
- **Retention policy** — shown plainly to the user: data is kept 90 days after cancellation before deletion. This is what makes one-click reactivation possible and is a visible trust commitment.
- **API keys** — generate and manage API keys for external connections — Pro plan only.

LAYER 1 Screens

- **Profile** — identity, timezone, currency, delete account.
- **Subscription** — plan, transitions, states, next billing.
- **Billing** — payment history, invoices, payment method.
- **Team** — members, permissions, activity log, plan-gated slots.
- **Data** — export, import, retention policy, API keys.

LAYER 2 Actions

129. **Upgrade** — pay and unlock immediately (prorated).
130. **Downgrade** — schedule for renewal; keep the current tier until then.
131. **Cancel** — run the exit survey, keep access to cycle-end.
132. **Reactivate** — one click within 90 days, data intact.
133. **Manage team** — add, remove, edit within plan slots.
134. **Export / delete** — export data anytime; delete account with export and survey first.

LAYER 3 States

- **Subscription state** — active, trial, inactive, cancelled — the subscription lifecycle.
- **Downgrade pending** — scheduled for renewal; current tier held until then.
- **In retention window** — cancelled but within 90 days; reactivation possible, data intact.
- **In grace** — expired but within the 24-hour grace; everything still works.
- **Locked (past grace)** — locked from actions, data intact, weekly email warnings.

LAYER 4 Rules

LOCKED RULE Fully self-serve — every routine account action is doable without contacting support.

LOCKED RULE Upgrade is immediate and prorated; downgrade takes effect at renewal with no clawback of what was already paid for.

LOCKED RULE Inactive means only subscription-related actions are possible; a pending downgrade means only new-tier actions are possible. Data always remains.

LOCKED RULE Failed-payment dunning: warn 3 days before expiry, 24-hour grace after expiry (all works), then locked with data intact and a weekly email warning, and deletion only after 90 days inactive.

LOCKED RULE On downgrade, exceeding the new tier (team size OR features in use) triggers a warn-ahead and holds the downgrade pending until the business resolves it — access is never silently stripped.

LOCKED RULE Cancel and delete both run the exit survey, whose reason data flows to the Super Admin churn analytics.

LOCKED RULE 90-day retention after cancellation, shown to the user, backing one-click reactivation. Data export on every plan; API keys Pro-only.

Future automation

Several things are done manually at launch by deliberate choice — some because the automated path depends on infrastructure not yet built, some because they need a paid integration, and a few because the manual judgment IS the control and should never be automated. This section lists what is manual now and honestly flags what is a real candidate for future automation, so nobody reads a launch limitation as a permanent one.

Real candidates for future automation

- **Multi-touch attribution** — multi-touch attribution modeling — journey modeling, cross-platform deduplication, and view-through attribution (the Triple Whale, Northbeam, Hyros territory). Launch does last-click, first-party attribution anchored to delivered orders. The heavier modeling is a future integration with one of those platforms, or a Numbatrak engine built later.
- **Full accounting** — the full accounting engine — chart of accounts, double-entry journals, vouchers, suppliers, balance sheet, cash flow, and bank reconciliation. Launch ships a lighter P&L and cash view; formal accounting is handled in Zoho Books for now, and building the full engine in-app is future work.
- **Bank reconciliation** — bank-feed reconciliation — the accountant currently reviews each Wallet remittance against the bank statement by hand (human oversight, not an in-app gate). A future bank-feed integration could auto-reconcile.
- **Payroll disbursement** — payroll auto-disbursement — Numbatrak currently calculates pay and marks it paid, but the actual money is paid outside the system. A future Paystack or bank integration could disburse directly, not just mark paid.
- **Ad spend import** — ad spend auto-pull — buyers currently type daily spend from their Meta or TikTok dashboard. A future Ads API integration could pull spend automatically (the orders half is already automatic from the system's own data).
- **Messaging** — messaging automation — order confirmations, abandoned-cart recovery, and mark-delivered messages depend on the Messaging and Integrations layer. They are CRS-driven or manual now and light up automatically once WhatsApp, SMS, and email APIs are connected.

Manual by design — should stay manual

These are not limitations waiting to be automated. The human judgment is the feature, and automating it would remove a control:

- **Damaged/missing stock** — damaged or missing stock requires a human reason and does not auto-flow to expenses — the reason and the movement history are the control against shrinkage being hidden.
- **Who-received-money** — the who-received-the-money flag on an order (agent, company account, or prepaid) is a human decision that drives whether a Wallet remittance line is created.
- **Remittance oversight** — the accountant's oversight of remittances is deliberately a review in business chats, not a blocking in-app gate — the human check against the bank statement stays human.

Document status

This is a living draft. Twenty-four features are locked, plus both cross-cutting layers (Messaging & Integrations, and Notifications). The core product feature specification is complete. What remains is a separate body of work — the SaaS Infrastructure section (Super Admin dashboard, billing and dunning engine, onboarding, health metrics, support, security), plus pricing tiers and the legal/marketing layer — to be built out as its own clearly-outlined section.

Standing rule: no analytics or list view is written without its filter set named. Every dashboard and analytics page in this product is a filterable engine.

All decisions route through the founder.
