

NUMBATRAK

Business Performance Dashboard

Feature Specification · Version 1.0 · Confidential · 2026

Know Your Numbers.

Most Nigerian e-commerce businesses are generating revenue but not seeing profit clearly. This document defines the Business Performance Dashboard — the feature inside Numbatrak that puts every critical metric in one place, pre-calculated, with no spreadsheets, no formulas, and no guesswork.

— SECTION 01 —

The Problem This Feature Solves

A Nigerian e-commerce business can spend ₦4.6 million in expenses and walk away with ₦165,000 in profit. The simple plus and minus adds up. But the numbers hide the truth. There is a leakage somewhere and without the right metrics in front of you, you cannot see it, let alone fix it.

The most dangerous version of this problem is when everything looks fine on the surface. Orders are coming in. Revenue is growing. Facebook is reporting good ROAS. But at the end of the month, the profit is almost nothing — because delivery costs are creeping, the real CPA is higher than Facebook shows, operational expenses are eating into margins, and nobody has a single place to see all of it together.

"Revenue is not profit. ROAS is not business ROI. Facebook's CPA is not your real CPA. These are three different things and most Nigerian e-commerce founders are confusing them daily."

The Business Performance Dashboard solves this. It takes the data already inside Numbatrak — orders, expenses, ad spend, delivery costs, COGS — and automatically calculates every critical metric. The business owner opens Numbatrak and within five seconds knows exactly how their business is performing. No spreadsheets. No manual calculations. No guesswork.

— SECTION 02 —

What the Dashboard Shows

The dashboard is built around ten core metrics. Every metric is pre-calculated automatically from data already entered in Numbatrak. The business owner never needs to run a formula manually.

The metrics are displayed in the order of importance — from the most fundamental (how many orders) to the most critical (how much profit). Each one is visible at a glance at the top of the dashboard before any scrolling.

THE 10 CORE METRICS — CALCULATED AUTOMATICALLY

01	Total Orders Generated Live Now SOURCE: Order collection system — all orders entered via form, manual entry, bulk upload, or connected channels FORMULA: COUNT of all orders in selected time period DISPLAYED AS: A single bold number. e.g. 218 orders this month
02	Total Orders Delivered Live Now SOURCE: Delivery management — orders with status marked as Delivered FORMULA: COUNT of orders where status = Delivered DISPLAYED AS: A single bold number with delivery count vs total. e.g. 82 of 120 delivered
03	Delivery Rate Live Now SOURCE: Orders generated vs orders delivered FORMULA: (Total Delivered ÷ Total Orders Generated) × 100 DISPLAYED AS: Percentage with colour indicator — Green above target, Amber approaching danger, Red below minimum
04	Average Order Value (AOV) Live Now

	SOURCE: Sales price of all delivered orders FORMULA: Total sales value of delivered orders ÷ Total delivered orders DISPLAYED AS: Currency figure. e.g. ₦40,219 average per customer. Only uses delivered orders — undelivered orders have not generated real revenue
05	Platform CPA vs Real CPA Live Now SOURCE: Ad spend from advertising expense tracker + order data FORMULA: Platform CPA: Ad spend ÷ Total orders generated Real CPA: Ad spend ÷ Total orders delivered Gap: Real CPA minus Platform CPA DISPLAYED AS: Two numbers shown side by side with the gap between them highlighted. The gap shows how much Facebook or Meta is understating your true acquisition cost due to delivery rate
06	Average Cost of Goods Sold (COGS) Live Now SOURCE: Inventory — cost price per product × quantity per delivered order FORMULA: Total cost price of all delivered orders ÷ Total delivered orders DISPLAYED AS: Currency figure. Accounts for bundles and multi-unit orders automatically — not just single unit price. e.g. ₦6,005 average COGS per delivered order
07	Average Delivery Fee per Order Live Now SOURCE: Delivery management — delivery cost recorded per order FORMULA: Total delivery fees paid ÷ Total delivered orders DISPLAYED AS: Currency figure. e.g. ₦5,400 average delivery cost per order
08	Profit Per Order Live Now SOURCE: AOV, Real CPA, Average COGS, Average Delivery Fee FORMULA: AOV minus Real CPA minus Avg COGS minus Avg Delivery Fee DISPLAYED AS: Currency figure. The single most important number on the dashboard. e.g. ₦12,119 profit per delivered order
09	Total Profit (Delivered) Live Now SOURCE: Profit per order × total delivered orders

	FORMULA: Profit Per Order × Total Delivered Orders
	DISPLAYED AS: Currency figure. e.g. ¥ 994,000 total profit from delivered orders. Cross-checks against delivered revenue minus all expense categories
10	ROAS vs Business ROI Live Now
	SOURCE: Ad spend, total revenue, total expenses
	FORMULA: ROAS: Total ad revenue ÷ Total ad spendBusiness ROI: Total profit after all expenses ÷ Total investment
	DISPLAYED AS: Two clearly labelled separate numbers — never combined. Tooltip explains the difference for business owners who confuse the two

— SECTION 03 —

Real Numbers — Demo Walkthrough

The following numbers are taken from a real business session that informed the design of this feature. This is what the Business Performance Dashboard would have shown automatically — instead of being calculated manually across multiple spreadsheets.

BUSINESS CONTEXT — TWO FUNNELS RUNNING SIMULTANEOUSLY

Funnel 1: Afro Soul — 58 orders generated, 36 delivered. 62% delivery rate.
Funnel 2: Second offer — 62 orders generated, 46 delivered. 74% delivery rate.
Combined: 120 orders generated, 82 delivered. ₦1,369,000 total ad spend.

METRIC · VALUE IN DEMO · HOW CALCULATED

Total Orders Generated	120 orders	58 + 62 from both funnels
Total Orders Delivered	82 orders	36 + 46 from both funnels
Delivery Rate	68%	(82 ÷ 120) × 100
Total Sales Price	₦3,298,000	₦1,530,000 + ₦1,768,000
Average Order Value	₦40,219	₦3,298,000 ÷ 82 delivered
Platform CPA (Facebook)	₦11,408	₦1,369,000 ÷ 120 orders
Real CPA (after delivery rate)	₦16,695	₦1,369,000 ÷ 82 delivered

CPA Gap (hidden cost)	₦5,287 per order	$\text{₦16,695} \text{ minus } \text{₦11,408}$
Total COGS (both funnels)	₦539,000	$\text{₦283,500} + \text{₦255,500}$
Average COGS per order	₦6,005	$\text{₦539,000} \div 82 \text{ delivered}$
Total Delivery Fees	₦446,000	$\text{₦191,500} + \text{₦254,500}$
Average Delivery Fee	₦5,400	$\text{₦446,000} \div 82 \text{ delivered}$
Profit Per Order	₦12,119	$\text{₦40,219} - \text{₦16,695} - \text{₦6,005} - \text{₦5,400}$
Total Delivered Profit	₦994,000	$\text{₦12,119} \times 82 \text{ delivered}$

THE INSIGHT THIS REVEALS:

Facebook reported a CPA of ₦11,408. The real CPA after accounting for delivery rate was ₦16,695. The gap was ₦5,287 per order — multiplied across 82 orders that is ₦433,574 in hidden cost that Facebook never showed. This is the number that makes the difference between thinking you are profitable and knowing you are.

At the same time, the minimum order value on the store was ₦32,500. But the AOV came out at ₦40,219 because customers buying bundles pushed it up. This means the pricing strategy is working and the product mix is healthy — a critical insight only visible when the AOV is calculated correctly from delivered orders.

— SECTION 04 —

Funnel-Level vs Business-Level View

When a business is running multiple ad funnels — different offers, different price points, different media buyers — the same ten metrics must be calculated per funnel individually, then aggregated into one business-level view automatically.

Why Funnel Separation Matters

In the demo, two funnels were running simultaneously on the same product. Funnel 1 had a 62% delivery rate. Funnel 2 had a 74% delivery rate. The combined rate was 68%. Without separating them, it is impossible to know which funnel is more profitable and which one to scale.

If the business owner only saw the combined 68%, they would not know that one funnel is performing 12 percentage points better than the other. That difference in delivery rate, at their volume, changes the profit calculation significantly.

How It Works in Numbatrak

When creating a campaign or offer in Numbatrak, the business owner names it — for example 'Afro Soul Discount Funnel' or '2-for-1 Main Offer'. All orders from that funnel are tagged to it. All ad spend entered is assigned to a funnel or split across funnels.

THE TWO VIEWS THE BUSINESS OWNER CAN TOGGLE BETWEEN:

- Individual Funnel View — all 10 metrics calculated for one specific funnel or offer. Shows exactly how that campaign is performing in isolation
- Business Total View — all funnels combined into one aggregated truth. This is the overall business performance across all selling activity

Both views update in real time as new orders come in, delivery statuses update, and expenses are recorded.

Multiple Media Buyers

When different media buyers are running ads on the same funnel, their spend is recorded separately but aggregated into the funnel total. The business owner can see total ad spend per funnel without needing to split by individual media buyer unless they choose to drill down.

— SECTION 05 —

Red Flag Alerts

The Business Performance Dashboard does not just show numbers. It watches them. When a key metric moves outside a healthy range, Numbatrak flags it automatically so the business owner does not need to check everything manually every day.

Thresholds are set by the business owner during onboarding or in their settings. Numbatrak watches against those thresholds and sends alerts via the dashboard notification system — and later via WhatsApp and email.

TRIGGER · WHAT IT MEANS · THRESHOLD

 RED	Delivery rate drops below target Revenue is being generated but not collected. Profit formula is breaking down silently. <i>Threshold: Set by owner on onboarding. Default suggestion: flag below 65%</i>
 AMBER	Real CPA rises above target It is costing more to acquire each paying customer. Profit per order is shrinking. <i>Threshold: Set by owner. Numbatrak flags if CPA increases more than 15% week-on-week</i>
 AMBER	Average delivery fee increases week-on-week Logistics costs are creeping. This silently reduces profit per order. <i>Threshold: Flag if delivery fee rises more than 10% vs prior week average</i>
 RED	Operational expense exceeds set ratio of gross profit The business is spending too much of what it earns just to keep running. <i>Threshold: Set by owner. Default suggestion: flag if operational expense exceeds 80% of delivered profit</i>
 RED	Profit per order drops below minimum target The core economics of the business are deteriorating. <i>Threshold: Set by owner on onboarding based on their target margin</i>
 AMBER	Platform CPA vs Real CPA gap widens significantly Delivery rate is declining. Facebook looks fine but real cost is rising. <i>Threshold: Flag if gap between platform CPA and real CPA widens by more than 20%</i>

How Alerts Are Delivered

- In-dashboard notification — visible on opening Numbatrak
- WhatsApp alert to business owner — Q3 2025
- Email alert to business owner — Q3 2025
- Weekly summary report — all metrics with trend indicators — Post 1K Users

— SECTION 06 —

The Profit Formula

This is the formula Numbatrak uses to calculate profit per order. It is the same formula a business owner would use manually — but Numbatrak does it automatically using data already in the system.

Average Order Value

minus Real CPA (Ad Spend ÷ Delivered Orders)

minus Average Cost of Goods Sold

minus Average Delivery Fee per Order

= Profit Per Order

Profit Per Order × Total Delivered Orders = Total Profit

This formula uses delivered orders throughout — not total orders generated. This is the correct approach because undelivered orders generate no revenue. Using total orders instead of delivered orders would overstate performance and hide the true impact of delivery rate on profitability.

ROAS vs Business ROI — The Critical Distinction

"ROAS tells you how your ads are performing. Business ROI tells you if your business is actually making money. They are two different numbers and they must never be confused."

ROAS — Return on Ad Spend — is calculated as: total revenue generated from ads ÷ total ad spend. It is an advertising metric. A ROAS of 2.5x means for every \$1 spent on ads, \$2.50 in revenue was generated. It says nothing about profit.

Business ROI is calculated after all expenses — COGS, delivery fees, operational expenses, marketing expenses, and ad spend — have been subtracted from revenue. This is the real number. A business can have a strong ROAS and a near-zero business ROI if operational expenses are too high.

In the demo: ROAS on ₦1.369M ad spend was approximately 2.4x — reasonable. But after operational expenses of ₦1.1–1.2M were applied to the ₦994K delivered profit, the final business profit was significantly lower. The ROAS looked healthy. The business ROI told a different story.

Numbatrak shows both numbers clearly labelled and side by side. It never merges them or presents one as a substitute for the other.

— SECTION 07 —

Pricing Intelligence

One of the most powerful uses of the Business Performance Dashboard is pricing. Most Nigerian e-commerce businesses price based on what competitors charge or what feels right. Numbatrak gives them the numbers to price correctly — based on what the business actually needs to be profitable.

The Pricing Formula

Once a business owner knows their four key costs, they can set their price with confidence:

Minimum Viable Price = Real CPA + COGS + Delivery Fee + Target Profit Per Order

In the demo: ₦16,695 CPA + ₦6,005 COGS + ₦5,400 delivery = ₦28,100 minimum to break even. The store was priced at ₦32,500 minimum which gave ₦4,400 minimum profit per order at baseline. Because customers bought bundles, AOV reached ₦40,219 giving ₦12,119 profit per order on average.

Without these numbers, the business owner cannot know if their price is sustainable. With them, they can adjust pricing instantly when any cost changes.

What Numbatrak Shows to Support Pricing Decisions

- Current cost structure — CPA, COGS, and delivery fee updated in real time as new data comes in
- Minimum viable price — calculated automatically based on current costs and target margin
- Current AOV vs minimum viable price — shows how much headroom exists in the current pricing
- Impact of cost changes — if delivery fee increases by ₦500, what happens to profit per order
- Bundle performance — average order value broken down to show what bundles customers are choosing most

— SECTION 08 —

Future Updates to This Feature

The Business Performance Dashboard is a living feature. As more businesses use Numbatrak and more patterns emerge, new metrics and tools will be added. The following are confirmed directions for future updates.

Capacity and Projection Calculator — Post 1K Users

Based on current team size, current delivery rate, current AOV, and current CPA, Numbatrak will project the maximum achievable monthly profit at full operational capacity. This answers the question every growing Nigerian e-commerce founder asks: given my team and my numbers, how much should I be making?

In the demo, this was identified as a key insight — with current team strength running a single product, the potential monthly profit was ₦8M. The projection calculator will make this visible automatically.

Scenario Modelling — Post 1K Users

Interactive what-if calculations built into the dashboard. Examples:

- What happens to monthly profit if delivery rate improves from 68% to 75%?
- What happens if Real CPA drops by ₦3,000?
- What happens if we increase AOV by offering a higher-value bundle?
- What is the break-even order volume for this month's operational expenses?

Weekly and Monthly Trend Lines — Post 1K Users

Every metric on the dashboard will have a trend line showing whether it is improving or declining over time. Delivery rate trending down for 3 consecutive weeks is a different situation from a one-week dip. Trend visibility prevents overreaction to noise and helps identify real problems early.

Category Benchmarks — Future Vision

Anonymised and aggregated benchmark data from all businesses on Numbatrak in the same product category. A fashion brand can see how their delivery rate, AOV, and CPA compares to other fashion brands on the platform. This gives context that no individual business can generate alone.

Meta Ads API — Direct Connection — Post 1K Users

When the Meta Ads API is connected, all ad spend data pulls automatically into Numbatrak. No manual entry. Platform CPA and Real CPA are calculated in real time without the business owner inputting a single number. The gap between what Facebook reports and what the business actually experiences becomes visible automatically.

Team Performance Integration — Live Now

Staff performance data from Numbatrak's HR dashboard is connected to business performance metrics. The business owner can see — at current team capacity, with current delivery rates and CPA — what the maximum output of the team should be and whether the numbers match. This connects human performance to business performance in one view.

— SECTION 09 —

How It Works Technically

The Business Performance Dashboard does not require any new data entry from the business owner. It reads from data already in Numbatrak and runs calculations automatically. Here is where each metric gets its data from.

DATA SOURCE MAP

METRIC	DATA SOURCE IN NUMBATRAK	UPDATES WHEN
Total Orders Generated	Order collection — all sources	<i>New order enters system</i>
Total Orders Delivered	Delivery management — status = delivered	<i>Order status updated to delivered</i>
Delivery Rate	Calculated from above two	<i>Either order count changes</i>
Average Order Value	Sales price field on delivered orders	<i>New delivery confirmed</i>
Platform CPA	Ad spend entered in advertising tracker	<i>Ad spend updated or new order added</i>
Real CPA	Ad spend ÷ delivered orders	<i>Either value changes</i>
Average COGS	Inventory — cost price × quantity per order	<i>New delivery confirmed</i>
Average Delivery Fee	Delivery cost field per order	<i>New delivery confirmed</i>
Profit Per Order	Calculated from AOV, CPA, COGS, delivery	<i>Any input metric changes</i>
Total Profit	Profit per order × delivered count	<i>Any input metric changes</i>
ROAS	Ad spend + total revenue from ads	<i>Ad spend or revenue updated</i>
Business ROI	All expense categories + total profit	<i>Any expense or revenue changes</i>

All calculations run automatically on the server. The dashboard display updates in real time as new data enters Numbatrak through any connected channel — order form, manual entry, bulk upload, eChiba sync, or API connection.

— SECTION 10 —

Quick Reference

The 10 Metrics at a Glance

1. Total Orders Generated — count of all orders in period
2. Total Orders Delivered — count of orders with status = delivered
3. Delivery Rate — $(\text{delivered} \div \text{generated}) \times 100$
4. Average Order Value — $\text{total sales value of delivered orders} \div \text{delivered count}$
5. Platform CPA vs Real CPA — $\text{ad spend} \div \text{generated orders}$ vs $\text{ad spend} \div \text{delivered orders}$
6. Average COGS — $\text{total cost price of delivered orders} \div \text{delivered count}$
7. Average Delivery Fee — $\text{total delivery fees} \div \text{delivered orders}$
8. Profit Per Order — $\text{AOV} - \text{Real CPA} - \text{COGS} - \text{delivery fee}$
9. Total Profit — $\text{profit per order} \times \text{delivered orders}$
10. ROAS vs Business ROI — advertising metric vs real business profitability metric

The Profit Formula

$$\begin{aligned} \text{AOV} - \text{Real CPA} - \text{Avg COGS} - \text{Avg Delivery Fee} &= \text{Profit Per Order} \\ \text{Profit Per Order} \times \text{Delivered Orders} &= \text{Total Profit} \end{aligned}$$

Feature Status

The One Thing This Feature Does

"A business owner opens Numbatrak and within five seconds knows exactly how profitable their business is — without running a single formula, opening a spreadsheet, or asking anyone for a number."

For feature questions, roadmap decisions, or product updates, all decisions route through the founder.

Numbatrak Business Performance Dashboard · Feature Specification v1.0 · 2026
